The Situation of Women
and Children

JAMAICA

Multiple Indicator Cluster Survey 2022
Survey Findings Report:
The Situation of Women and Children

The Jamaica Multiple Indicator Cluster Survey (MICS) was carried out in 2022 by the Planning Institute of Jamaica (PIOJ) in collaboration with the United Nations Children's Fund (UNICEF), the Inter-American Development Bank (IDB) and the Statistical Institute of Jamaica (STATIN), as part of the Global MICS Programme. Technical support was provided by UNICEF and financial support was provided by both UNICEF and the IDB.

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments. In summary, the main objectives of the Jamaica MICS were:

1. To provide high quality data to assess the situation of women, children and households, and measure progress made towards the achievement of global and national social-related goals;
2. To provide disaggregated data for the identification of disparities, to inform the development of evidence-based policies and programmes aimed at social inclusion and the most vulnerable;
3. To establish a mobile phone database that allows the implementation of short, rapid surveys to a nationally representative sample, to assist in crises monitoring and intervention, measuring program coverage, and opinion polling;
4. To provide disaggregated data on some key COVID-19 related indicators; and
5. To contribute to the improvement of data and monitoring systems in Jamaica, and to strengthen technical expertise in the design, implementation and analysis of such systems.

The objective of this report is to facilitate the timely dissemination and use of results from the Jamaica MICS. The report contains detailed information on the survey methodology, and all standard MICS tables. The report is accompanied by a series of Statistical Snapshots of the main findings of the survey.

For more information on the Global MICS Programme, please go to mics.unicef.org.

SUMMARY TABLE OF SURVEY IMPLEMENTATION AND THE SURVEY POPULATION

Survey sample and implementation			
Sample frame - Updated	2011 Population and Housing Census 2019	Questionnaires	Household Women (age 15-49) Children under five Children age 5-17
Interviewer training	March – April, 2022	Fieldwork	April – August, 2022
Survey sample			
Households		Women (age 15-49)	
- Sampled	7,903	- Eligible for interviews	5,213
- Occupied	7,401	- Interviewed	4,890
- Interviewed	7,118	- Response rate (Per cent)	93.8
- Response rate (Per cent)	96.2		
Children under five		Children age 5-17	
- Eligible for interviews	1,484	- Number in interviewed households	4,313
- Mothers/caretakers Interviewed	1,432	- Eligible	2,725
- Response rate (Per cent)	96.5	- Mothers/caretakers interviewed	2,644
		- Response rate (Per cent)	97.0

Survey population			
Average household size	2.9	Percentage of population living in	
Percentage of population under:		- Urban areas	52.2
- Age 5	7.1	▪ Greater Kingston Metropolitan Area	30.7
- Age 18	27.8	▪ Other Urban Centres	21.5
		- Rural areas	47.8

ACKNOWLEDGEMENTS

The Planning Institute of Jamaica (PIOJ), on behalf of the Government of Jamaica, extends appreciation to all organisations and individuals who played a role in the successful implementation of Jamaica's fourth round of the Multiple Indicator Cluster Survey (MICS) in 2022.

We thank the United Nations Children's Fund (UNICEF) for its continued collaboration with the Government of Jamaica to ensure the availability of high-quality data to inform decision-making concerning the most vulnerable, and specifically for providing technical and financial resources to ensure the data produced in the Jamaica 2022 MICS are of the highest quality.

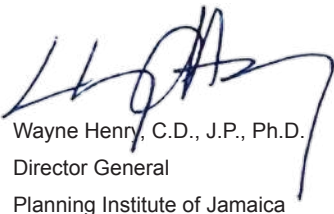

Our heartfelt appreciation to the Inter-American Development Bank (IDB), which, in furtherance of its support of a post-pandemic recovery that is socially inclusive, contributed significant financial resources to the Jamaica 2022 MICS efforts.

Many thanks to the Statistical Institute of Jamaica (STATIN), which, even in the midst of preparations for the National Population and Housing Census, made the time to design and select the sample of households to be included in this MICS, as well as assist with the training of field staff, to ensure high quality and representative results for the country.

We wish to thank all the members of the MICS Steering and Technical Committees, which provided technical guidance and management oversight throughout the life of the MICS implementation. These committees consisted of members across various Government Ministries, Agencies and Departments, the University of the West Indies, international organizations, the PIOJ and partners from non-governmental organizations.

We hereby acknowledge and thank Balcostics Limited, the company which undertook the MICS data collection activities, including the recruitment of field staff, pre-testing of the survey instruments, facilitation of the training of the field staff, data collection and secondary editing.

Above all, the PIOJ sincerely thanks all household members who cooperated with the MICS data collection teams to ensure that current and representative data are available for effective, national decision-making in Jamaica.

Wayne Henry, C.D., J.P., Ph.D.
Director General
Planning Institute of Jamaica

1. INTRODUCTION

This report is based on the Jamaica Multiple Indicator Cluster Survey (MICS), conducted in 2022 by the Planning Institute of Jamaica (PIOJ), in collaboration with the United Nations Children's Fund (UNICEF), the Statistical Institute of Jamaica (STATIN) and the Inter-American Development Bank (IDB). The survey provides statistically sound and internationally comparable data essential for developing evidence-based policies and programmes, and for monitoring progress toward national goals and global commitments.

A Commitment to Action: National and International Reporting Responsibilities

More than two decades ago, the **Plan of Action for Implementing the World Declaration on the Survival, Protection and Development of Children in the 1990s** called for:

"Each country should establish appropriate mechanisms for the regular and timely collection, analysis and publication of data required to monitor relevant social indicators relating to the well-being of children Indicators of human development should be periodically Reviewed by national leaders and decision makers, as is currently done with indicators of economic development..."

The Multiple Indicator Cluster Surveys programme was developed soon after, in the mid-1990s, to support countries in this endeavour.

Governments that signed the **World Fit for Children Declaration and Plan of Action** also committed themselves to monitoring progress towards the goals and objectives:

"We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research"
(A World Fit for Children, paragraph 60)

Similarly, the **Millennium Declaration** (paragraph 31) called for periodic reporting on progress:

"...We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action."

The General Assembly Resolution, adopted on 25 September 2015, "**Transforming Our World: the 2030 Agenda for Sustainable Development**" stipulates that for the success of the universal SDG agenda,

"quality, accessible, timely and reliable disaggregated data will be needed to help with the measurement of progress and to ensure that no one is left behind" (paragraph 48); recognizes that "...baseline data for several of the targets remains unavail able..." and calls for "...strengthening data collection and capacity building in Member States..."

Vision 2030 Jamaica, Jamaica's long-term National Development Plan (NDP), covers the period from 2009 to 2030 and aims to make Jamaica "the place of choice to live, work, raise families and do business"¹. In 2015, Jamaica adopted the 2030 Agenda for Sustainable Development and its 17 SDGs, which have been integrated into the implementation of Vision 2030 Jamaica. To this end, the Jamaican government has elected to present Voluntary National Review (VNR) Reports (2018, 2022) on the SDGs, and this most recent MICS will provide data on 26 SDG indicators.

¹ <https://www.vision2030.gov.jm/>

Alignment of Vision 2030 Jamaica and Sustainable Development Goals (SDGs)

Source: "Medium Term Socio-Economic Policy Framework 2021-2024" (PIOJ, 2022)

The NDP integrates 31 Sector Plans, which provides the framework for implementation of Vision 2030 Jamaica at the sectoral level, covering areas such as health, education, population, gender, poverty reduction, ICT, persons with disabilities, and water, to identify a few². These Sector Plans form the basis on which Jamaica's Medium Term Socio-Economic Policy Frameworks (MTF) are developed. In addition to presenting the detailed strategies and development results from National Goals/SDGs to programme outputs/outcomes, the 2021-2024 MTF supports results-based monitoring and evaluation of progress under Vision 2030 Jamaica. The data from the MICS are therefore timely, as they will identify progress achieved up to 2022 and provide guidance on areas for programme implementation in the upcoming planning cycles³.

² <https://www.pioj.gov.jm/wp-content/uploads/2022/11/Medium-Term-Socio-Economic-Policy-Framework-MTF-2021-2024.pdf> /

³ PIOJ. Vision 2030 Jamaica – National Development Plan (NDP): How-to guide: tips for using medium term socio-economic policy framework (MTF) 2021-2024. / Planning Institute of Jamaica. Retrieved Feb 8, 2023 from https://www.vision2030.gov.jm/wp-content/uploads/sites/2/2022/11/How-to-Guide_-_Tips-for-Using-MTF-2021-2024.pdf

The 2022 Jamaica MICS has as its primary objectives:

- To provide high quality data for assessing the situation of children, adolescents, women and households in Jamaica;
- To furnish data needed for monitoring progress toward national goals, as a basis for future action;
- To collect disaggregated data for the identification of disparities, to inform policies aimed at social inclusion of the most vulnerable;
- To validate data from other sources and the results of focused interventions;
- To generate data on national and global SDG indicators;
- To generate internationally comparable data for the assessment of the progress made in various areas, and to put additional efforts in those areas that require more attention;
- To generate behavioural and attitudinal data not available in other data sources.

This report presents the results of the 2022 Jamaica MICS. Following Chapter 2 on survey organisation and methodology, including sample design and implementation, all indicators covered by the survey, with their definitions, are presented in “Indicators and definitions”. Prior to presenting the survey results, organized into thematic chapters, the coverage of the sample and the main characteristics of respondents is covered in Chapter 4, “Sample coverage and characteristics of respondents”. Thereafter, all survey results are presented in five thematic chapters⁴. In each chapter, a brief introduction of the topic and the description of all tables, are followed by the tabulations.

The following chapter, “Thrive – Child health, nutrition and development” presents findings on immunisation, disease episodes, diarrhoea, household energy use, symptoms of acute respiratory infection, fever, infant and young child feeding, and early childhood development.

Learning is the topic of the next chapter, where survey findings on early childhood education, educational attendance, parental involvement in children’s education, and foundational learning skills are covered.

The next chapter, “Protected from violence and exploitation”, includes survey results on birth registration, child discipline, child labour, child marriage, victimisation, feelings of safety, and attitudes toward domestic violence.

Chapter 10, “Live In a safe and clean environment”, covers the topics of drinking water, handwashing, and sanitation.

The final thematic chapter is on equity – titled “Equitable chance in life”, the chapter presents findings on a range of equity related topics, including child functioning, social transfers, discrimination and harassment, and subjective well-being.

The report ends with appendices, with detailed information on sample design, personnel involved in the survey, estimates of sampling errors, data quality, and the questionnaires used.

⁴ Chapters 5 (Survive) and 6 (Thrive – Reproductive and maternal health), are deliberately missing from this report. Data on these topics were not collected in the Jamaica MICS 2022, as they were collected in the recently concluded nationally representative Jamaica Reproductive Health Survey, 2021-2022. The original chapter numbering from the MICS Survey Findings report template has been retained to facilitate ease of international comparisons.

2. SURVEY ORGANISATION AND METHODOLOGY

2.1 Survey organisation

The Jamaica MICS 2022 was implemented by a Survey Management Team formed and led by the Planning Institute of Jamaica (PIOJ). Oversight was provided by a Steering Committee and technical decisions and processes were guided and supported by a Technical Committee.⁵ The Global MICS Team of UNICEF provided on and off-site support and reviews during key phases of the survey as per the standard Technical Collaboration Framework of the global MICS programme and the Memorandum of Understanding between the PIOJ and UNICEF.

2.2 Sample design

The sample for the Jamaica MICS 2022 was designed to provide estimates for a large number of indicators on the situation of children and women at the national level, and for three regions: (a) the Greater Kingston Metropolitan Area (GKMA), comprising the whole of Kingston, St. Andrew urban, Spanish Town, and Portmore; (b) other urban centres (OUC); and (c) rural areas. The urban and rural areas within each parish were identified as the main sampling strata and the sample of households was selected in two stages. The sampling frame was based on a master sample maintained by the Statistical Institute of Jamaica for its household survey program. The master sample is based on the 2011 Population and Housing Census data and cartographic materials updated with dwelling counts and locational information from the 2019 Listing of Dwellings. The first stage selection for the master sample involved the selection of census enumeration districts (EDs) with probability proportional to size (PPS) within each stratum. A subsample of the master sample EDs was selected with PPS within each stratum for the Jamaica MICS. A systematic sample of 20 households was drawn in each sample enumeration area from the occupied households in the 2019 Listing of Dwellings. The total sample size was 7,903⁶ households in 390 sample EDs. Despite some logistical and safety challenges, all selected enumeration areas were visited during the fieldwork period. As the sample is not self-weighting, sample weights are used for reporting survey results. A more detailed description of the sample design can be found in Appendix A: Sample Design.

2.3 Questionnaires

Four questionnaires were used in the survey: 1) a household questionnaire to collect basic demographic information on all de jure household members (usual residents), the household, and the dwelling; 2) a questionnaire for individual women administered in each household to all women age 15-49 years; 3) an under-5 questionnaire, administered to mothers (or caretakers) of all children under 5 living in the household; and 4) a questionnaire for children age 5-17 years, administered to the mother (or caretaker) of one randomly selected child age 5-17 years living in the household.⁷ The questionnaires included the following modules:

⁵ Membership of the Survey Management Team, Steering and Technical Committees are listed in Appendix B.

⁶ While the planned sample size was 7,800 households, multiple households were discovered by interviewers in some of the selected dwellings, which were not accounted for in the 2019 Listing of Dwellings. As per the MICS methodology, these additional households were also interviewed, which brought the total sample to 7,903 households.

⁷ Children age 15-17 years living without their mother and with no identified caretaker in the household were considered emancipated and the questionnaire for children age 5-17 years was administered directly to them. This slightly reworded questionnaire that only includes the Child's Background, Child Labour and Child Functioning modules is not reproduced in Appendix E.

Household Questionnaire	Questionnaire for Individual Women	Questionnaire for Children Age 5-17 Years	Questionnaire for Children Under 5
List of Household Members Education Household Characteristics Social Transfers Household Energy Use Water and Sanitation Handwashing	Woman's Background Mass Media and ICT Attitudes Toward Domestic Violence Victimisation Tobacco and Alcohol Use Life Satisfaction	Child's Background Child Labour Child Discipline Child Functioning Parental Involvement Foundational Learning Skills	Under-Five's Background Birth Registration Early Childhood Development Child Discipline Child Functioning Breastfeeding and Dietary Intake Immunisation Care of Illness

Additionally, for each questionnaire, a request for consent for the respondent to be included in the MICS Plus sample for future surveys was added.

In addition to the administration of questionnaires, fieldwork teams observed the place for handwashing. Details and findings of these observations are provided in the respective sections of the report. Further, the questionnaire for children age 5-17 years included a reading and mathematics assessment administered to children age 7-14 years.

The questionnaires were based on the MICS6 standard questionnaires⁹, with some country-specific questions on COVID-19 added in both the Questionnaire for Children Age 5-17 Years and the Questionnaire for Children Under 5. From the MICS6 model English version, the questionnaires were customised and pre-tested in the rural communities of Treadways and Watermount in St. Catherine and Constitution Hill in St. Andrew, as well as in the urban communities of Central in Kingston, Waterford in St. Catherine and Harbour View in St. Andrew, during January 2022. Based on the results of the pre-test, modifications were made to the wording of the questionnaires. A copy of the Jamaica MICS 2022 questionnaires is provided in Appendix E in English.

2.4 Ethical protocol

The survey protocol was approved by the Advisory Panel on Ethics and Medico-Legal Affairs in the Ministry of Health and Wellness in April, 2022. The protocol included a Protection Protocol which outlines the potential risks during the life cycle of the survey and management strategies to mitigate these.

Verbal consent was obtained for each respondent participating and, for children age 15-17 years individually interviewed, adult consent was obtained in advance of the child's assent. All respondents were informed of the voluntary nature of participation and the confidentiality and anonymity of information. Additionally, respondents were informed of their right to refuse answering all or particular questions, as well as to stop the interview at any time.

⁹ <http://mics.unicef.org/tools#survey-design>.

2.5 Data collection method

MICS surveys utilise Computer-Assisted Personal Interviewing (CAPI). The data collection application was based on the CSPro (Census and Survey Processing System) software, Version 7.6.2, including a MICS dedicated data management platform. Procedures and standard programs⁹ developed under the global MICS programme were adapted to the Jamaica MICS 2022 final questionnaires and used throughout. The CAPI application was tested in the rural communities of St. Peters and Mount James in St. Andrew and Troja in St. Catherine, as well as in the urban communities of Hannah Town in Kingston and Waltham Gardens in St. Andrew during March 2022. Based on the results of the CAPI-test, modifications were made to the questionnaires and application.

2.6 Training

Training for the fieldwork was conducted for 20 days in March to April, 2022. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training on paper questionnaires, followed by training on the CAPI application. The trainees spent two days in field practice and one day on a full pilot survey. The pilot survey was conducted in areas surrounding the two training sites, in St. Andrew and Mandeville. The training agenda was based on the template MICS6 training agenda.¹⁰

Field Supervisors attended additional training on the duties of team supervision and responsibilities.

2.7 Fieldwork

The data were collected by 15 teams; each was comprised of three to four interviewers and a supervisor. Fieldwork began in April 2022 and concluded in August 2022.

Data was collected using tablet computers running the Windows 10 operating system, utilising a Bluetooth application for field operations, enabling transfer of assignments and completed questionnaires between supervisor and interviewer tablets.

2.8 Fieldwork quality control measures

Team supervisors were responsible for the daily monitoring of fieldwork. Mandatory re-interviewing was implemented on one household per cluster. Daily observations of interviewer skills and performance was conducted.

During the fieldwork period, each team was visited multiple times by survey management team members and field visits were arranged for UNICEF MICS Team members.

Throughout the fieldwork, field check tables (FCTs) were produced weekly for analysis and action with field teams. The FCTs were customised versions of the standard tables produced by the MICS Programme.¹¹

2.9 Data management and editing

Data were received at the central office via Internet File Streaming System (IFSS) integrated into the management application on the supervisors' tablets. Whenever logistically possible, synchronisation was daily. The central office communicated application updates to field teams through this system.

⁹<http://mics.unicef.org/tools#data-processing>

¹⁰ <http://mics.unicef.org/tools#survey-design>

¹¹ <http://mics.unicef.org/tools#data-collection>

During data collection and following the completion of fieldwork, data were edited according to the editing process described in detail in the Data Editing Guidelines, a customised version of the standard MICS6 documentation.¹²

2.10 Analysis and reporting

Sample weights and background characteristics were computed and added to the final data. Analysis was done using the Statistical Package for Social Sciences (SPSS) software, Version 24. Model syntax and tabulation plan developed by UNICEF were customised and used for this purpose.¹³

The Survey Findings Report and accompanying Statistical Snapshots were drafted based on the templates developed by the global MICS Programme¹⁴. These were presented and reviewed by subject matter experts during the Data Interpretation and Report Compilation (DIRC) Workshop held in Kingston December 6-8, 2022. The finalisation of the Survey Findings Report and Statistical Snapshots was managed by the Survey Management Team with guidance from the Technical Committee and the participants in the DIRC Workshop.

2.11 Data Sharing

Unique identifiers such as location and personal details collected during interviews were removed from datasets to ensure privacy. These anonymised data files are made available on the PIOJ website¹⁵ and on the MICS website¹⁶ and can be freely downloaded for legitimate research purposes. Users are required to submit final research to entities listed in the included readme file, strictly for information purposes.

3. INDICATORS AND DEFINITIONS

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS					
SR.1	Access to electricity	7.1.1	HC	Percentage of household members with access to electricity	97.7
SR.2	Literacy rate (age 15-24 years)		WB	Percentage of women age 15-24 years who are able to read a short simple statement about everyday life or who attended post-secondary or higher education	95.2
SR.3	Exposure to mass media		MT	Percentage of women age 15-49 years who, at least once a week, read a newspaper or magazine, listen to the radio, and watch television	19.5
SR.4	Households with a radio		HC	Percentage of households that have a radio	68.2
SR.5	Households with a television		HC	Percentage of households that have a television	88.9
SR.6	Households with a telephone		HC – MT	Percentage of households that have a telephone (fixed line or mobile phone)	96.4
SR.7	Households with a computer		HC	Percentage of households that have a computer	54.1
SR.8	Households with internet		HC	Percentage of households that have access to the internet by any device from home	66.0
SR.9	Use of computer		MT	Percentage of women age 15-49 years who used a computer during the last 3 months	51.7
SR.10	Ownership of mobile phone	5.b.1	MT	Percentage of women age 15-49 years who own a mobile phone	96.4

¹⁷Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. MICS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by MICS. The latter cases are included here as long as the current international methodology allows for only the way that the MICS indicator is defined, and/or a significant part of the SDG indicator can be generated by the MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

¹⁸Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

¹⁹All MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value
SR.11	Use of mobile phone		MT	Percentage of women age 15-49 years who used a mobile telephone during the last 3 months	98.2
SR.12a SR.12b	Use of internet	17.8.1	MT	Percentage of women age 15-49 years who used the internet (a) during the last 3 months (b) at least once a week during the last 3 months	86.4 84.6
SR.13a SR.13b	ICT skills	4.4.1	MT	Percentage of women who have carried out at least one of nine specific computer related activities during the last 3 months (a) age 15-24 (b) age 15-49	58.7 44.5
SR.14a	Use of tobacco	3.a.1	TA	Percentage of women age 15-49 years who smoked cigarettes or used smoked or smokeless tobacco products at any time during the last one month	6.4
SR.14b	Non-smokers	3.a.1	TA	Percentage of women age 15-49 years who did not smoke cigarettes or any other smoked tobacco product during the last one month	94.6
SR.15	Smoking before age 15		TA	Percentage of women age 15-49 years who smoked a whole cigarette before age 15	1.6
SR.16	Use of alcohol		TA	Percentage of women age 15-49 years who had at least one alcoholic drink at any time during the last one month	32.6
SR.17	Use of alcohol before age 15		TA	Percentage of women age 15-49 years who had at least one alcoholic drink before age 15	5.7
SR.18	Children's living arrangements		HL	Percentage of children age 0-17 years living with neither biological parent	14.5
SR.19	Prevalence of children with one or both parents dead		HL	Percentage of children age 0-17 years with one or both biological parents dead	8.9
SR.20	Children with at least one parent living abroad		HL	Percentage of children age 0-17 years with at least one biological parent living abroad	15.3

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value ²⁰
THRIVE - CHILD HEALTH, NUTRITION AND DEVELOPMENT					
TC.1	Tuberculosis immunization coverage		IM ²¹	Percentage of children age 12-23 months who received BCG containing vaccine at any time before the survey	100
TC.2	Polio immunization coverage		IM	Percentage of children age 12-23 months who received at least one dose of Inactivated Polio Vaccine (IPV) and the third/fourth dose of either IPV or Oral Polio Vaccine (OPV) vaccines at any time before the survey	95.0
TC.3	Diphtheria, tetanus and pertussis (DTP) immunization coverage	3.b.1 & 3.8.1	IM	Percentage of children age 12-23 months who received the third dose of DTP containing vaccine (DTP3) at any time before the survey	89.4
TC.4	Hepatitis B immunization coverage		IM	Percentage of children age 12-23 months who received the third/fourth dose of Hepatitis B containing vaccine (HepB3) at any time before the survey	89.4
TC.5	Haemophilus influenzae type B (Hib) immunization coverage		IM	Percentage of children age 12-23 months who received the third dose of Hib containing vaccine (Hib3) at any time before the survey	89.4
TC.8	Rubella immunization coverage		IM	Percentage of children age 24-35 months who received rubella containing vaccine at any time before the survey	95.2
TC.10	Measles immunization coverage	3.b.1	IM	Percentage of children age 24-35 months who received the second measles containing vaccine at any time before the survey	61.9
TC.11a TC.11b	Full immunization coverage ²²		IM	Percentage of children who at age a) 12-23 months had received all basic vaccinations at any time before the survey b) 24-35 months had received all vaccinations recommended in the national immunization schedule	88.6 55.5
TC.12	Care-seeking for diarrhoea		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	31.8
TC.13a TC.13b	Diarrhoea treatment with oral rehydration salt solution (ORS) and zinc		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received a) ORS b) ORS and zinc	44.3 2.8
TC.14	Diarrhoea treatment with oral rehydration therapy (ORT) and continued feeding		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received ORT (ORS packet, pre-packaged ORS fluid, recommended homemade fluid or increased fluids) and continued feeding during the episode of diarrhoea	50.3

²⁰ (*) Figures that are based on fewer than 25 unweighted cases.

²¹ Values for immunization represents crude coverage, which include both observed records and mother's report. See the Child Health, Nutrition and Development chapter of this report for the breakdown.

²² For children age 12-23 months, basic vaccinations include: BCG, 3 doses of polio, 3 doses of DTP vaccination. Measles 1 is administered at 12 months and therefore excluded from basic antigens for children 12-23 months. All vaccinations include BCG, 1st Booster Polio, DPT3, HepB3, Hib3, Rubella, Mumps, 1st Booster DPT and Measles 2 as per the vaccination schedule in Jamaica.

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value ²⁰
TC.15	Primary reliance on clean fuels and technologies for cooking		EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking (living in households that reported cooking)	92.6
TC.17	Primary reliance on clean fuels and technologies for lighting		EU	Percentage of household members with primary reliance on clean fuels and technologies for lighting (living in households that reported the use of lighting)	97.7
TC.18	Primary reliance on clean fuels and technologies for cooking, and lighting	7.1.2	EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking, and lighting ²³	91.6
TC.19	Care-seeking for children with acute respiratory infection (ARI) symptoms	3.8.1	CA	Percentage of children under age 5 with ARI symptoms in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	(*)
TC.20	Antibiotic treatment for children with ARI symptoms		CA	Percentage of children under age 5 with ARI symptoms in the last 2 weeks who received antibiotics	(*)
TC.26	Care-seeking for fever		CA	Percentage of children under age 5 with fever in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	50.4
TC.S30a	Children ever breastfed (Modified)		BD	Percentage of children age 0-35 months who were ever breastfed	93.7
TC.32	Exclusive breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who are exclusively breastfed ²⁴	33.0
TC.33	Predominant breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who received breast milk as the predominant source of nourishment ²⁵ during the previous day	41.9
TC.34	Continued breastfeeding at 1 year		BD	Percentage of children age 12-15 months who received breast milk during the previous day	47.0
TC.35	Continued breastfeeding at 2 years		BD	Percentage of children age 20-23 months who received breast milk during the previous day	33.3
TC.36	Duration of breastfeeding		BD	The age in months when 50 percent of children age 0-35 months did not receive breast milk during the previous day	13.8
TC.37	Age-appropriate breastfeeding		BD	Percentage of children age 0-23 months appropriately fed ²⁶ during the previous day	45.7

²³ Household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator

²⁴ Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines

²⁵ Infants who receive breast milk and certain fluids (water and water-based drinks, fruit juice, ritual fluids, oral rehydration solution, drops, vitamins, minerals, and medicines), but do not receive anything else (in particular, non-human milk and food-based fluids)

²⁶ Infants age 0-5 months who are exclusively breastfed, and children age 6-23 months who are breastfed and ate solid, semi-solid or soft foods

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value ²⁰
TC.38	Introduction of solid, semi-solid or soft foods		BD	Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	86.3
TC.39a TC.39b	Minimum acceptable diet		BD	Percentage of children age 6–23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day (a) breastfed children (b) non-breastfed children	33.3 34.0
TC.40	Milk feeding frequency for non-breastfed children		BD	Percentage of non-breastfed children age 6-23 months who received at least 2 milk feedings during the previous day	69.0
TC.41	Minimum dietary diversity		BD	Percentage of children age 6–23 months who received foods from 5 or more food groups ²⁷ during the previous day	51.4
TC.42	Minimum meal frequency		BD	Percentage of children age 6-23 months who received solid, semi-solid and soft foods (plus milk feeds for non-breastfed children) the minimum number of times ²⁸ or more during the previous day	61.7
TC.43	Bottle feeding		BD	Percentage of children age 0-23 months who were fed with a bottle during the previous day	73.2
TC.49a TC.49b TC.49c	Early stimulation and responsive care		EC	Percentage of children age 24-59 months engaged in four or more activities to provide early stimulation and responsive care in the last 3 days with (a) Any adult household member (b) Father (c) Mother	85.3 14.1 66.0
TC.50	Availability of children's books		EC	Percentage of children under age 5 who have three or more children's books	44.1
TC.51	Availability of playthings		EC	Percentage of children under age 5 who play with two or more types of playthings	80.3
TC.52	Inadequate supervision		EC	Percentage of children under age 5 left alone or under the supervision of another child younger than 10 years of age for more than one hour at least once in the last week	3.1
TC.53	Early childhood development index 2030 (ECDI2030)	4.2.1	EC	Percentage of children age 2-4 years who are developmentally on track in health, learning and psychosocial well-being.	93.8

²⁷ The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

²⁸ Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6-8 months, and three times for children 9-23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6-23 months

PR.S2a			UCD – FCD	Percentage of children age 1-14 years who experienced any physical punishment and/or psychological aggression by caregivers in the past one month ³⁰	76.3
PR.3		8.7.1	CL	Percentage of children age 5-17 years who are involved in child labour ³¹	3.6
PR.4a PR.4b		5.3.1	MA	Percentage of women age 20-24 years who were first married or in union (a) before age 15 (b) before age 18	5.6 26.9
PR.5			MA	Percentage of women age 15-19 years who are married or in union	21.9
PR.6			MA	Percentage of women age 15-49 years who are in a polygynous union	5.6
PR.7a PR.7b			MA	Percentage of women who are married or in union and whose spouse is 10 or more years older (a) age 15-19 years (b) age 20-24 years	14.3 19.5
PR.12			VT	Percentage of women age 15-49 years who experienced physical violence of robbery or assault within the last 12 months	8.1
PR.13		16.3.1	VT	Percentage of women age 15-49 years experiencing physical violence of robbery and/or assault in the last 12 months and reporting the last incidences of robbery and/or assault experienced to the police	48.4
PR.14		16.1.4	VT	Percentage of women age 15-49 years feeling safe walking alone in their neighbourhood after dark	64.0
PR.15			DV	Percentage of women age 15-49 years who state that a husband is justified in hitting or beating his wife in at least one of the following circumstances: (1) she goes out without telling him, (2) she neglects the children, (3) she argues with him, (4) she refuses sex with him, (5) she burns the food	5.2

³⁰ Standard MICS/SDG indicator with cultural types of punishment added.

³¹ Child labourers are defined as children involved in economic activities or in household chores above the age-specific thresholds. While the concept of child labour includes exposure to hazardous working conditions, and this is collected in MICS and was previously included in the reported indicator, the present definition, which is also used for SDG reporting, does not include children who are working under hazardous conditions. See Tables PR.3.1-4 for more detailed information on thresholds and classifications.

4. SAMPLE COVERAGE AND CHARACTERISTICS OF RESPONDENTS

4 SAMPLE COVERAGE AND CHARACTERISTICS OF RESPONDENTS

4.1 Results of interviews

Table SR.1.1 presents results of the sample implementation, including response rates. Of the 7,903 households included in the sample, 7,401 were found occupied. Of these, 7,118 were successfully interviewed for a household response rate of 96.2 percent.

In the interviewed households, 5,213 women (age 15-49 years) were identified. Of these, 4,890 were successfully interviewed, yielding a response rate of 93.8 percent within the interviewed households.

There were 1,484 children under age five found in interviewed households. Questionnaires were completed for 1,432 of these children, which corresponds to a response rate of 96.5 percent within interviewed households.

A sub-sample of children age 5-17 years was used to administer the questionnaire for children age 5-17. Only one child was selected randomly in each household interviewed, and there were 4,313 children age 5-17 years identified in the interviewed households. Of these children, 2,725 were selected, and questionnaires were completed for 2,644, which corresponds to a response rate of 97.0 percent within the interviewed households.

Overall response rates of 90.2 percent, 92.8 percent, and 93.3 percent are calculated for the individual interviews of women, children under-5, and children age 5-17 years, respectively.

Table SR.1.1: Results of household, women's, under-5's and children age 5-17's interviews

Number of households, women, children under 5, and children age 5-17 by interview results, by area of residence, Jamaica MICS, 2022

4.2 Housing and household characteristics

Tables SR.2.1, SR.2.2 and SR.2.3 provide further details on housing and household level characteristics obtained in the Household Questionnaire. Most of the information collected on these characteristics have been used in the construction of the wealth index.

Table SR.2.1 presents characteristics of housing, disaggregated by area of residence, distributed by whether the dwelling has electricity and internet access, the type of energy used for cooking, the main materials of the flooring, roof, and exterior walls, as well as the number of rooms used for sleeping.

In Table SR.2.2 households are distributed according to ownership of assets by households and by individual household members. This also includes ownership of dwelling.

Table SR.2.3 shows how the household populations in areas and regions are distributed according to household wealth quintiles.

Table SR.2.1: Housing characteristics

Percent distribution of households by selected housing characteristics, by area of residence, Jamaica MICS, 2022

4.3 Household composition

Tables SR.3.1 provides the distribution of households by selected background characteristics, including the sex of the household head, area, number of household members, education of household head, and ethnicity and religion/denomination³². Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provide background information on the representativeness of the survey sample. The remaining tables in this report are presented only with weighted numbers.³³

The presented background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report.

The weighted and unweighted total number of households are equal, since sample weights were normalized.³³

The table also shows the weighted mean household size estimated by the survey.

³² This was determined by asking about the head of the household's ethnic background and religion. In terms of ethnicity, the Jamaican population is largely homogenous, therefore religion was added to allow further identification of differences among the population.

³³ See Appendix A: Sample design, for more details on sample weights.

Table SR.3.1: Household composition

Percent and frequency distribution of households, Jamaica MICS, 2022

	Weighted percent	Number of households	
		Weighted	Unweighted

Table SR.3.1: Household composition

Percent and frequency distribution of households, Jamaica MICS, 2022

	Weighted percent	Number of households	
		Weighted	Unweighted
Households with^A			
At least one child under age 5 years	17.3	1,232	1,227
At least one child age 5-17 years	38.7	2,754	2,725
At least one child age <18 years	45.0	3,200	3,160
At least one woman age 15-49 years	53.2	3,789	3,747
At least one man age 15-49 years	48.0	3,419	3,452
No member age <50	25.6	1,824	1,838
No adult (18+) member	0.1	4	3
Mean household size	2.9	7,118	7,118

^A Each proportion is a separate characteristic based on the total number of households

4.4 Age structure of household population

The weighted age and sex distribution of the survey population is provided in Table SR.4.1. In the households successfully interviewed in the survey, a weighted total of 21,055 household members was listed. Of these, 9,862 were males, and 11,193 were females.³⁴

Table SR.4.1: Age distribution of household population by sex

Percent and frequency distribution of the household population^a in five-year age groups and child (age 0-17 years) and adult populations (age 18 or more), by sex, Jamaica MICS, 2022

	Males		Females		Total	
	Number	Percent	Number	Percent	Number	Percent

55-59	570	5.8	664	6.0	1,234	5.9
60-64	491	5.0	571	5.1	1,062	5.1
65-69	385	3.9	465	4.2	850	4.1
70-74	364	3.7	380	3.4	744	3.5
75-79	217	2.2	266	2.4	483	2.3
80-84	130	1.3	157	1.4	287	1.4
85+	133	1.4	215	1.9	347	1.7
Child and adult populations						
Children age 0-17 years	2,966	30.2	2,867	25.7	5,832	27.8
Adults age 18+ years	6,850	69.8	8,284	74.3	15,134	72.2

^a As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those found for individuals in tables SR.5.1W, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights.

4.5 Respondents' background characteristics

Tables SR.5.1W, SR.5.2, and SR.5.3 provide information on the background characteristics of female respondents 15-49 years of age, children under age 5 and children age 5-17 years. In all these tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalized (standardized).³³

³⁴ The single year age distribution is provided in Table DQ.1.1 in Appendix D: Data quality

Note that in Table SR.5.3, an additional column is presented (Weighted total number of children age 5-17 years) to account for the random selection of one child in households with at least one child age 5-17 years. The final weight of each child is the weight of the household multiplied by the number of children age 5-17 years in the household.

In addition to providing useful information on the background characteristics of women, children age 5-17, and children under age five, the tables are also intended to show the numbers of observations in each background category. These categories are used in the subsequent tabulations of this report.

Table SR.5.1W provide background characteristics of female respondents, age 15-49 years. The table includes information on the distribution of women according to area of residence, age, education³⁵, marital/union status, health insurance, ethnicity and religion/denomination of the household head, and wealth index quintiles.^{36, 37}

Background characteristics of children age 5-17 and under 5 are presented in Tables SR.5.2 and SR.5.3. These include the distribution of children by several attributes: sex, area of residence, age in months, mother's (or caretaker's) education, respondent type, health insurance, functional difficulties (for children under age 5 only for age 2-4 years), ethnicity and religion/denomination of the household head and wealth index quintiles.

³⁵ Throughout this report when used as a background variable, unless otherwise stated, "education" refers to highest educational level ever attended by the respondent.

³⁶ The wealth index is a composite indicator of wealth. To construct the wealth index, principal components analysis is performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth, to generate weights (factor scores) for each of the items used. First, initial factor scores are calculated for the total sample. Then, separate factor scores are calculated for households in urban and rural areas. Finally, the urban and rural factor scores are regressed on the initial factor scores to obtain the combined, final factor scores for the total sample. This is carried out to minimize the urban bias in the wealth index values. Each household in the total sample is then assigned a wealth score based on the assets owned by that household and on the final factor scores obtained as described above. The survey household population is then ranked according to the wealth score of the household they are living in, and is finally divided into 5 equal parts (quintiles) from lowest (poorest) to highest (richest). In the Jamaica MICS, the following assets were used in these calculations: Persons per sleeping room; type of floor, roof, and wall; household assets (non-electric and electrical); electricity; household members' personal assets; ownership of computer and mobile phone; availability of household internet; land ownership; ownership of livestock; ownership of bank account; type of cookstove and type of energy used for cooking and lighting; source and location of drinking water; access to sufficient water; type, location and sharing status of sanitation facility; availability of water and soap at place for handwashing; and domestic help. The wealth index is assumed to capture the underlying long-term wealth through information on the household assets, and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in:

Filmer, D., and L. Pritchett. "Estimating Wealth Effects without Expenditure Data — or Tears: An Application to Educational Enrollments in States of India*." *Demography* 38, no. 1 (2001): 115-32. doi:10.1353/dem.2001.0003.;

³⁷ When describing survey results by wealth quintiles, appropriate terminology is used when referring to individual household members, such as for instance "women in the richest population quintile", which is used interchangeably with "women in the wealthiest survey population", "women living in households in the richest population wealth quintile", and similar.

Table SR.5.3: Children age 5-17 years' background characteristics

Percent and frequency distribution of children age 5-17 years, Jamaica MICS, 2022

	Weighted percent	Weighted total number of children age 5-17 years ^A	Number of households with at least one child age 5-17 years	
			Weighted	Unweighted
Wealth index quintile				
Poorest	23.4	973	561	550
Second	21.7	904	548	554
Middle	20.7	861	543	555
Fourth	18.3	762	522	528
Richest	15.9	662	470	457

^A As one child is randomly selected in each household with at least one child age 5-17 years, the final weight of each child is the weight of the household multiplied with the number of children age 5-17 years in the household. This column is the basis for the weighted percent distribution, i.e. the distribution of all children age 5-17 years in sampled households.

^B In this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent: Mothers (or caretakers, interviewed only if the mother is deceased or is living elsewhere). The category of "Emancipated" applies to children age 15-17 years as described in note C. This category is not presented in individual tables.

^C Children age 15-17 years were considered emancipated and individually interviewed if not living with his/her mother and the respondent to the Household Questionnaire indicated that the child does not have a primary caretaker.

^D The results of the Child Functioning module are presented in Chapter 11.1.

4.6 Literacy

As a measure of the effectiveness of the primary education system, the literacy rate is often seen as a proxy measure of social progress and economic achievement. In MICS, literacy is assessed on the ability of the respondent to read a short simple statement or based on school attendance.

Table SR.6.1W shows the survey findings for the total number of interviewed women. The Youth Literacy Rate, MICS Indicator SR.2, is calculated for women age 15-24 years and presented in the Age disaggregate in the table.

Note that those who have ever attended post-secondary or higher education are immediately classified as literate, due to their education level and are therefore not asked to read the statement. All others who successfully read the statement are also classified as literate. The table is designed as full distributions of the survey respondents, by level of education ever attended. The total percentage literate presented in the final column is the sum of literate women among those with 1) primary or less education, 2) lower secondary education, 3) upper secondary education, 4) special education, and 5) those with at least some post-secondary education.

The percent missing includes those for whom no sentence in the required language was available or for whom no response was reported.

Table SR.6.1W: Literacy (women)

4.7 Migratory status

The Background module of the Jamaica MICS 2022 asked respondents to the Individual Questionnaire for Women how long they have been continuously living in the current residence and, if they were not living there since birth, whether they lived in a city, town or rural area and the name of the region they lived in before moving to their current place of residence. Tables SR.7.1Wa, 7.1Wb and 7.1Wc present the percentage of women who have changed residence according to the time since last move and also compares the place of residence of each individual at the time of the survey with that of the last place of residence and the type of residence.

4.8 Mass media and ICT

The Jamaica MICS collected information on exposure to mass media and the use of computers and the internet. Information was collected on exposure to newspapers/magazines, radio and television among women age 15-49 years and is presented in Table SR.9.1W.

Table SR.9.2 presents information on the household ownership of Information and Communication Technology (ICT) equipment (radio, television, fixed telephone line or mobile telephone³⁸ and computer) and access to internet.

Table SR.9.3W presents the use of ICT by women age 15-49 years based on the information about whether they have ever used computers, mobile phones or internet and during the last three months while table SR.9.4W presents the ICT skills of women age 15-49 years based on the information about whether they carried out computer related activities in the last three months.

³⁸ In addition to the specific question in the Household Questionnaire about whether any member of this household has a mobile phone, households are considered as owning mobile phone if any individual woman (or man) age 15-49 years responded yes to the question about ownership of mobile telephones in the individual questionnaires for women and men age 15-49 years.

Table SR.9.1W: Exposure to mass media (women)

Percentage of women age 15-49 years who are exposed to specific mass media on a weekly basis, Jamaica MICS, 2022

	Percentage of women who:					Number of women
	Read a newspaper at least once a week	Listen to the radio at least once a week	Watch television at least once a week	All three media at least once a week ¹	Any media at least once a week

4.9 Tobacco and alcohol use

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, or snuffed. All contain the highly addictive psychoactive ingredient, nicotine. Tobacco use is one of the main risk factors for a number of chronic diseases, including cancer, lung diseases, and cardiovascular diseases.³⁹ If mentioned, e-cigarettes are included in the other response category of smokeless tobacco product use.

The consumption of alcohol carries a risk of adverse health and social consequences related to its intoxicating, toxic and dependence-producing properties. In addition to the chronic diseases that may develop in those who drink large amounts of alcohol over a number of years, alcohol use is also associated with an increased risk of acute health conditions, such as injuries, including from traffic accidents.⁴⁰ Alcohol use also causes harm far beyond the physical and psychological health of the drinker. It harms the well-being and health of people around the drinker. An intoxicated person can harm others or put them at risk of traffic accidents or violent behaviour, or negatively affect co-workers, relatives, friends or strangers. Thus, the impact of the harmful use of alcohol reaches deep into society.^{41,42}

The Jamaica MICS collected information on ever and current use of tobacco and alcohol and intensity of use among women age 15-49 years. This section presents the main results.

Table SR.10.1W presents the current and ever use of tobacco products by women age 15-49 years. Table SR.10.2W presents results on age at first use of cigarettes, as well as frequency of use, while Table SR.10.3W shows the use of alcohol among women age 15-49 years.

4.10 Children's living arrangements

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, The Convention on the Rights of the Child (CRC) recognizes that “the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding”. Millions of children around the world grow up without the care of their parents for several reasons, including due to the premature death of the parents or their migration for work. In most cases, these children are cared for by members of their extended families, while in others, children may be living in households other than their own, as live-in domestic workers for instance. Understanding the children’s living arrangements, including the composition of the households in which they live and the relationships with their primary caregivers, is key to design targeted interventions aimed at promoting child’s care and wellbeing.

Table SR.11.1 presents information on the living arrangements and orphanhood status of children under age 18.

The Jamaica 2022 MICS included a simple measure of one particular aspect of migration related to what is termed “children left behind”, i.e. for whom one or both parents have moved abroad. While the amount of literature is growing, the long-term effects of the benefits of remittances versus the potential adverse psycho-social effects are not yet conclusive, as there is somewhat conflicting evidence available as to the effects on children. Table SR.11.2 presents information on the living arrangements and co-residence with parents of children under age 18.

Table SR.11.3 presents information on children under age 18 years not living with a biological parent according to relationship to the head of household and those living in households headed by a family member.

Table SR.11.1: Children's living arrangements and orphanhood

'-' denotes 0 unweighted case in the denominator

**Chapters 5 (Survive) and 6
(Thrive – Reproductive and maternal health)
are deliberately missing from
this report.**

Data on these topics were not collected in the Jamaica MICS 2022, as they were collected in the recently concluded nationally representative Jamaica Reproductive Health Survey, 2021-2022. The original chapter numbering from the MICS Survey Findings report template has been retained to facilitate ease of international comparisons.

7. THRIVE – CHILD HEALTH, NUTRITION AND DEVELOPMENT

7.1 Immunization

Immunization is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert between 2 and 3 million deaths each year.⁴³ It is one of the most cost-effective health investments, with proven strategies that make it accessible to even the most hard-to-reach and vulnerable populations.

The WHO Recommended Routine Immunizations for Children⁴⁴ recommends all children to be vaccinated against tuberculosis (BCG), diphtheria, tetanus, pertussis, polio, measles, hepatitis B, haemophilus influenzae type b, pneumococcal bacteria/disease, rotavirus, and rubella.⁴⁵

At the global level, SDG indicator 3.b.1 is used to monitor the progress of the vaccination of children at the national level. The proportions of the target population covered by BCG, polio, diphtheria, pertussis and tetanus (DPT) and measles are presented in Table TC.1.1.

All doses in the primary series are recommended to be completed before the child's first birthday, although depending on the epidemiology of disease in a country, the first doses of measles and rubella containing vaccines may be recommended at 12 months or later. The recommended number and timing of most other doses also vary slightly with local epidemiology and may include booster doses later in childhood.

The vaccination schedule followed by the Jamaica National Immunization Programme provides a birth dose of BCG, three doses of the Pentavalent vaccine containing DPT, Hepatitis B, and Haemophilus influenzae type b (Hib) antigens, three doses of Polio vaccine, two doses of the MMR vaccine containing measles, mumps, and rubella antigens. As per the schedule below, all vaccinations should be received during the first year of life except the doses of MMR at 12 and 18 months. Additionally, booster doses of Polio vaccine and vaccine containing DPT are received at 18 months. Taking into consideration this vaccination schedule, the estimates for full vaccination coverage from the Jamaica 2022 MICS are based on children age 12-23/24-35 months.

⁴³ "Immunization Highlights 2015." World Health Organization. June 27, 2016. Accessed August 23, 2018. [HTTP://WWW.WHO.INT/IMMUNIZATION/HIGHLIGHTS/2015/EN/](http://www.who.int/immunization/highlights/2015/en/).

⁴⁴ "WHO Recommendations for Routine Immunization - Summary Tables." World Health Organization. August 22, 2018. Accessed August 23, 2018. [HTTP://WWW.WHO.INT/IMMUNIZATION/POLICY/IMMUNIZATION_TABLES/EN/](http://www.who.int/immunization/policy/immunization_tables/en/).

⁴⁵ Additionally, vaccination against the human papillomavirus (HPV) is recommended for girls from 9 to 14 years of age⁴⁴, but coverage of this vaccine is not yet included in MICS, as methodology is under development.

AGE OF CHILD		TYPE OF VACCINE GIVEN		
	Birth	BCG		
	6 Weeks	1 st Polio	1 st DPT/Hepatitis B/Hib (Pentavalent)	
	3 Months	2 nd Polio	2 nd DPT/Hepatitis B/Hib (Pentavalent)	
	6 Months	3 rd Polio	3 rd DPT/Hepatitis B/Hib (Pentavalent)	
	12 Months	1 st MMR		
	18 Months	2 nd MMR	1 st Booster Polio	1 st Booster DPT
FOR ENTRY TO NURSERY AND BASIC SCHOOL, ALL THE ABOVE VACCINES ARE NECESSARY				
	4-6 Years	2 nd Booster Polio	2 nd Booster DPT	
FOR ENTRY TO PRIMARY SCHOOL, ALL THE ABOVE VACCINES ARE NECESSARY				

IMMUNIZATION, A KEY TO GOOD HEALTH

Information on vaccination coverage was collected for all children under three years of age. All mothers or caretakers were asked to provide vaccination cards/ Child Health and Development Passport (CHDP). If the vaccination card or CHDP for a child was available, interviewers copied vaccination information from the cards onto the MICS questionnaire. If no vaccination card or CHDP was available for the child, the interviewer proceeded to ask the mother to recall whether the child had received each of the vaccinations, and, for applicable antigens, how many doses were received. The final vaccination coverage estimates are based on information obtained from the vaccination card/CHDP and the mother's report of vaccinations received by the child.

Tables TC.1.2a and 1.2b present vaccination coverage estimates among children age 12-23 and 24-35 months by background characteristics. The figures indicate children receiving the vaccinations at any time up to the date of the survey and are based on information from both the vaccination cards/CHDP and mothers'/caretakers' reports.

With the emergence of the COVID-19 virus in Jamaica in March 2020, part of the government's management strategy has been the ongoing vaccination of the population against COVID-19, which began in March 2021, and in November 2021, Jamaica began the administration of the COVID-19 vaccine to children age 12-17 years. The Jamaica MICS 2022 collected COVID-19 vaccine coverage information for children age 12-17 years, based on the mother's/primary caretaker's report. These findings are presented in Table TC.1.3.

Table TC.1.1: Vaccinations in the first years of life

Percentage of children age 12-23 months and 24-35 months vaccinated against vaccine preventable childhood diseases at any time before the survey (Crude coverage) and by their first birthday, Jamaica MICS, 2022

7.2 Disease episodes

A key strategy for achieving progress toward SDG 3.2: By 2030, end preventable deaths of new-borns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under-5 mortality to at least as low as 25 per 1,000 live births, is to tackle the diseases such as diarrhoea, pneumonia and malaria which are still among the leading killers of children under 5.⁴⁶ Target 3.3 of the SDGs on ending the epidemics on malaria by 2030 along with other diseases is interpreted as the attainment of the Global Technical Strategy for malaria 2016–2030 and the Roll Back Malaria advocacy plan, Action and Investment to defeat Malaria 2016–2030 targets which aim at reducing malaria mortality rates globally by 90 percent compared with 2015.

Table TC.2.1 presents the percentage of children under 5 years of age who were reported to have had an episode of diarrhoea, symptoms of acute respiratory infection (ARI) or fever during the 2 weeks preceding the survey. These results are not measures of true prevalence, and should not be used as such, but rather the period-prevalence of those illnesses over a two-week time window.

The definition of a case of diarrhoea or fever, in this survey, was the mother's (or caretaker's) report that the child had such symptoms over the specified period; no other evidence was sought beside the opinion of the mother. A child was considered to have had symptoms of ARI if the mother or caretaker reported that the child had, over the specified period, an illness with a cough with rapid or difficult breathing, and whose symptoms were perceived to be due to a problem in the chest or both a problem in the chest and a blocked or runny nose. While this approach is reasonable in the context of a multi-topic household survey, these basically simple case definitions must be kept in mind when interpreting the results, as well as the potential for reporting and recall biases. Further, diarrhoea, fever and ARI are not only seasonal but are also characterized by the often rapid spread of localized outbreaks from one area to another at different points in time. The timing of the survey and the location of the teams might thus considerably affect the results, which must consequently be interpreted with caution. For these reasons, although the period-prevalence over a two-week time window is reported, these data should not be used to assess the epidemiological characteristics of these diseases but rather to obtain denominators for the indicators related to use of health services and treatment.

⁴⁶ The main killers of children under age 5 in 2016 included preterm birth complications (18 per cent), pneumonia (16 per cent), intrapartum related events (12 per cent), diarrhoea (8 per cent), neonatal sepsis (7 per cent) and malaria (5 per cent). 7.3 Diarrhoea

Diarrhoea is one of the leading causes of death among children under five worldwide.⁴⁷ Most diarrhoea-related deaths in children are due to dehydration from loss of large quantities of water and electrolytes from the body in liquid stools. Management of diarrhoea – either through oral rehydration salt solution (ORS) or a recommended homemade fluid (RHF) – can prevent many of these deaths.⁴⁸ In addition, provision of zinc supplements has been shown to reduce the duration and severity of the illness as well as the risk of future episodes within the next two or three months.

Almost 60 per cent of deaths due to diarrhoea worldwide are attributable to unsafe drinking water and poor hygiene and sanitation. Hand washing with soap alone can cut the risk of diarrhoea by at least 40 per cent and significantly lower the risk of respiratory infections. Clean home environments and good hygiene are important for preventing the spread of both pneumonia and diarrhoea, and safe drinking water and proper disposal of human waste, including child faeces, are vital to stopping the spread of diarrhoeal disease among children and adults.⁵

In the MICS, mothers or caretakers were asked whether their child under age five years had an episode of diarrhoea in the two weeks prior to the survey. In cases where mothers reported that the child had diarrhoea, a series of questions were asked about the treatment of the illness, including what the child had been given to drink and eat during the episode and whether this was more or less than what was usually given to the child.

Table TC.3.1 shows the percentage of children age 0-59 months with diarrhoea in the two weeks preceding the survey for whom advice or treatment was sought and from where.

Table TC.3.2 shows patterns on drinking and feeding practices during diarrhoea among children age 0-59 months.

Table TC.3.3 shows the percentage of children age 0-59 months receiving ORS, various types of recommended homemade fluids and zinc during the episode of diarrhoea. Since children may have been given more than one type of liquid, the percentages do not necessarily add to 100.

Table TC3.4 provides the proportion of children age 0-59 months with diarrhoea in the last two weeks who received oral rehydration therapy with continued feeding, and the percentage of children with diarrhoea who received other treatments.

Table TC.3.5, which provides information on the source of ORS and zinc for children age 0-59 months who received these treatments, has been suppressed from this report, as the table is based on 25-49 unweighted cases, which does not allow for reliable disaggregation of the data. The Jamaica 2022 MICS found that for 84.6 percent of the children who were given ORS as treatment for diarrhoea in the last two weeks, the source of the ORS was a health facility or provider.

⁴⁷ UNICEF. One is Too Many: Ending Child Deaths from Pneumonia and Diarrhoea. New York: UNICEF, 2016. [HTTPS://DATA.UNICEF.ORG/WP-CONTENT/UP-LOADS/2016/11/UNICEF-PNEUMONIA-DIARRHOEA-REPORT2016-WEB-VERSION.PDF](https://data.unicef.org/wp-content/uploads/2016/11/UNICEF-PNEUMONIA-DIARRHOEA-REPORT2016-WEB-VERSION.PDF).

⁴⁸ In 2004, UNICEF and WHO published a joint statement with diarrhoea treatment recommendations for low-income countries, which promotes low-osmolarity rehydration salts (ORS) and zinc, in addition to continued feeding: WHO, and UNICEF. Clinical Management of Acute Diarrhoea. Joint Statement, New York: UNICEF, 2004. 7.4 Household energy use

There is a global consensus and an ever-growing body of evidence that expanding access to clean household energy for cooking, heating, and lighting is key to achieving a range of global priorities such as improving health, gender equality, equitable economic development and environmental protection. Goal 7 of the Sustainable Development Goals seeks to ensure access to affordable, reliable sustainable and modern energy for all by 2030 and would be measured as the percentage of the population relying on clean fuels and technology.⁴⁹

The Jamaica, 2022 MICS included a module with questions to assess the main technologies and fuels used for cooking and lighting. Information was also collected about the use of technologies with chimneys or other venting mechanisms which can improve indoor air quality through moving a fraction of the pollutants outdoors.

Households that use clean fuels and technologies for cooking are those mainly using electric stove, solar cooker, LPG (Liquefied Petroleum Gas)/cooking gas stove, biogas stove, or a liquid fuel stove burning ethanol/alcohol only. Table TC.4.1 presents the percent distribution of household members according to type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking.

Table TC.4.2 further presents the percent distribution of household members using polluting fuels and technologies for cooking according to type of cooking fuel mainly used by the household, and percentage of household members living in households using polluting fuels and technologies for cooking while Table TC.4.3 presents the percent distribution of household members in households using polluted fuels for cooking by type and characteristics of cookstove and by place of cooking.

Households that use clean fuels and technologies for lighting are those mainly using electricity, solar lantern, rechargeable or battery powered flashlight, torch or lantern, or biogas lamp. Table TC.4.6⁵⁰ presents the percent distribution of household members according to type of lighting fuel mainly used for lighting by the household, and percentage of household members living in households using clean fuels and technologies for lighting.

The questions asked about cooking and lighting help to monitor SDG indicator 7.1.2, "Proportion of population with primary reliance on clean fuels and technology" for cooking and lighting. Table TC.4.7 presents the percentage of household members living in households using clean fuels and technologies for cooking and lighting.

⁴⁹ WHO. *Burning Opportunity: Clean Household Energy for Health, Sustainable Development, and Wellbeing of Women and Children*. Geneva: WHO Press, 2016. [HTTP://APPS.WHO.INT/IRIS/BITSTREAM/HANDLE/10665/204717/9789241565233_ENG.PDF;JSESSIONID=63CEC48ED96098D4256007A76FEB8907?SEQUENCE=1](http://apps.who.int/iris/bitstream/handle/10665/204717/9789241565233_eng.pdf;jsessionid=63CEC48ED96098D4256007A76FEB8907?sequence=1).

⁵⁰ Tables TC.4.4 and 4.5 refers to space heating, which is irrelevant to the Jamaican context and as such, this sub-topic was not included in the Jamaica 2022 MICS.

¹ MICS indicator TC.18 - Primary reliance on clean fuels and technologies for cooking and lighting; SDG Indicator 7.1.2^A In order to be able to calculate the indicator, household members living in households that report no cooking or no lighting are not excluded from the numerator

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

7.5 Symptoms of acute respiratory infection

Information on symptoms of ARI were collected during the Jamaica 2022 MICS to capture symptoms related to pneumonia, a leading cause of death in children under five.⁵¹ Once diagnosed, pneumonia is treated effectively with antibiotics. Studies have shown a limitation in the survey approach of measuring pneumonia because many of the cases reported in surveys by the mothers or caretakers with symptoms of pneumonia are in fact, not true pneumonia.⁵² While this limitation does not affect the level and patterns of care-seeking for symptoms of ARI, it limits the validity of the level of treatment of ARI with antibiotics, as reported through household surveys. The treatment indicator described in this report must therefore be taken with caution.

Table TC.5.1, which presents the percentage of children with symptoms of ARI, which is also generally referred to as symptoms of pneumonia, in the two weeks preceding the survey for whom care was sought, by source of care and the percentage who received antibiotics, has been suppressed from this report, as the findings are based on fewer than 25 unweighted cases, with only 1.0 percent (see Table TC.2.1) of children under five having presented with symptoms of ARI in the last two weeks.

7.6 Fever

The Jamaica 2022 MICS included questions about children's fever episodes, to further capture information about caretakers' help-seeking behaviour when children display symptoms of illnesses.

Table TC.6.10⁵³ presents the percentage of children under age five with fever in the last two weeks for whom advice or treatment was sought by source of advice or treatment.

Mothers were also asked to report all of the medicines given to a child to treat the fever, including both medicines given at home and medicines given or prescribed at a health facility. Table TC.6.11 provide further insight on treatment of children with fever.

⁵¹ See section 7.2 of this report for additional details.

⁵² Campbell, H. et al. "Measuring Coverage in MNCH: Challenges in Monitoring the Proportion of Young Children with Pneumonia Who Receive Antibiotic Treatment." *PLoS Med* 10, no.5 (2013). doi:10.1371/journal.pmed.1001421

⁵³ Tables TC.6.1 to TC.6.9 covers the topic of malaria, and therefore have been excluded from the Jamaica, 2022 MICS, as malaria is not currently a challenge in the Jamaican context.

Table TC.6.10: Care-seeking during fever

Percentage of children age 0-59 months with fever in the last two weeks for whom advice or treatment was sought, by source of advice or treatment, Jamaica MICS, 2022

7.7 Infant and young child feeding

Optimal infant and young child feeding practices can increase survival and promote healthy growth and development, particularly during the critical window from birth to 2 years of age⁵⁴.

Breastfeeding in the first few years of life protects children from infection, provides an ideal source of nutrients and is economical and safe.⁵⁵ Despite these critical benefits, breastfeeding practices are suboptimal in many parts of the world. Many children do not start breastfeeding early enough, do not breastfeed exclusively for the recommended six months or stop breastfeeding too soon.⁵⁶ Mothers often face pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition^{57,58}. Infant formula and other breastmilk substitutes can also be life-threatening in settings where hygienic conditions and safe drinking water are not readily available. In some cases, it can be unsafe even with proper and hygienic preparation in the home due to food adulteration or other contamination that can affect unaware consumers.⁵⁹ As children reach the age of 6 months, their consumption of appropriate, adequate and safe complementary foods and continued breastfeeding leads to better health and growth outcomes, with the potential to reduce stunting during the first two years of life.⁶⁰

UNICEF and WHO recommend that infants be: (i) breastfed within one hour of birth; (ii) breastfed exclusively for the first six months of life; and (iii) breastfed for up to 2 years of age and beyond.⁶¹ Starting at 6 months, breastfeeding should be combined with safe, age-appropriate feeding of solid, semi-solid and soft foods with specific guiding principles available about how the feeding should be done with topics ranging from food consistency to responsive feeding.^{62,63} The breastfeeding recommendations and guiding principles for complementary feeding for which standard indicators^{64,65} have been developed, and which are collected in this survey, are listed in the table below.

Recommendation/ guiding principle	Indicators /proximate measures ⁶⁶	Notes on interpretation ⁶⁷	Table
Breastfeed exclusively for the first six months of life	Exclusive breastfeeding under 6 months Percentage of infants under 6 months of age who are exclusively breastfed ⁶⁸	Captures the desired practice for the entire population of interest (i.e., all children age 0-5 months should be exclusively breastfed) in a 24-hour period. It does not represent the proportion of infants who are exclusively breastfed every day from birth until they are 6 months of age and should not be interpreted as such.	TC 7.3
Introduce solid, semi-solid and soft foods at the age of 6 months	Introduction of solid, semi-solid or soft foods (age 6-8 months) Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	Captures the desired practice for the entire population of interest (i.e., all children age 6-8 months should eat solids) in a 24-hour period. It does not represent the proportion of infants who began receiving solids when they turned 6 months nor the proportion of children age 6-8 months who received solids every day since they turned 6 months of age and should not be interpreted as such.	TC 7.6
Continue frequent, on-demand breastfeeding for two years and beyond	Continued breastfeeding at 1 year and 2 years Percentage of children age 12-15 months (1 year) and 20-23 months (2 years) who received breast milk during the previous day	Captures the desired practice for different populations of interest (children should be breastfed for up to 2 years) in a 24-hour period. However, the label of 1 and 2 years can be confusing given the actual age range in months for each indicator.	TC.7.3
Provide meals with appropriate frequency and energy density	Minimum meal frequency (age 6–23 months) <u>Breastfed children:</u> Depending on age, at least two or three meals/snacks provided during the previous day <u>Non-breastfed children:</u> At least four meals/snacks <u>and/or milk feeds</u> provided during the previous day	This indicator represents the minimum number of meals and not adequacy. In addition, standard questionnaires do not distinguish if milk feeds were provided as part of a solid meal or as a separate meal. Meals may therefore be double counted for some non-breastfed children. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide foods with appropriate nutrient content	Minimum dietary diversity (age 6–23 months) At least five of eight food groups ⁶⁹ consumed in the 24 hours preceding the survey	This indicator represents the minimum dietary diversity and not adequacy. In addition, consumption of any amount of food from each food group is sufficient to "count" as the standard indicator is only meant to capture yes/no responses. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide foods with appropriate nutrient content	While it was not possible to develop indicators to fully capture guidance, one indicator does cover part of the principle: Not feeding with a bottle with a nipple		TC.7.8

In addition to the indicators in the table above, three dimensions of complementary feeding are combined to form a composite indicator of "minimum acceptable diet". This indicator assesses energy needs and nutrient adequacy (apart from iron). To have a minimum acceptable diet, a child must have received in the previous day:

- (i) The appropriate number of meals/snacks/milk feeds;
- (ii) Food items from at least 5 out of 8 food groups for breastfed children; and 4 out of 770 food groups for non-breastfed children; and
- (iii) At least two milk feeds for non-breastfed children.

⁶⁶ It should be noted that these indicators are, in general, proximate measures which do not capture the exact recommendations or guidelines, but serve as a basis for monitoring, providing useful information on the population of interest.

⁶⁷ For all indicators other than early initiation of breastfeeding, the definition is based on current status, that is, what happened during the day before the survey from the time when the child woke up to the time when he/she went to sleep until the morning of the day of the interview.

⁶⁸ Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines.

⁶⁹ The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) Breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

⁷⁰ Note that the denominator becomes 7 food groups for non-breastfed children in the composite indicator as the milk products group is removed from diet diversity, as this is assessed separately.

Table TC.7.1 is based on mothers'/caretakers' reports of whether the child was ever breastfed, with the indicator based on question BD2 in the Questionnaire for Children Under Five. It indicates the proportion of children age 0-35 months who were ever breastfed, and represents a modified version of this indicator, in keeping with the contents of the Jamaica 2022 MICS.

The set of infant and young child feeding indicators reported in tables TC.7.3⁷¹ through TC.7.6 are based on the mothers'/caretakers' report of consumption of food and liquids during the day or night prior to being interviewed. Data are subject to a number of limitations, some related to the respondent's ability to provide a full report on the child's liquid and food intake due to recall errors, as well as lack of knowledge in cases where the child was fed by other individuals.

In Table TC.7.3, breastfeeding status is presented for exclusively breastfed infants age 0–5 months (i.e. those who receive only breastmilk) and predominantly breastfed infants age 0–5 months (i.e. those who receive breastmilk in addition to plain water and/or non-milk liquids). The table also shows continued breastfeeding of children age 12–15 months and age 20–23 months.

Table TC.7.4 shows the median duration of any breastfeeding among children age 0–35 months and the median duration of exclusive breastfeeding and predominant breastfeeding among children age 0–23 months.

The age-appropriateness of breastfeeding practices for children under the age of 24 months is provided in Table TC.7.5. Different feeding criteria are used depending on the age of the child. For infants age 0–5 months, exclusive breastfeeding is considered age-appropriate feeding, while children age 6–23 months are considered appropriately fed if they are receiving breastmilk and solid, semi-solid or soft foods.

Table TC.7.6 further looks into the introduction of solid, semi-solid, or soft foods for infants age 6–8 months, while Table TC.7.7 presents the percentage of children age 6–23 months who received the minimum number and diversity of meals/snacks during the previous day (referring to solid, semi-solid, or soft food, but also milk feeds for non-breastfed children), by breastfeeding status.

The continued practice of bottle-feeding is a concern because of the potential for contamination if the bottle and/or nipple are not properly cleaned or sterilized. Bottle-feeding can also hinder breastfeeding due to nipple confusion, especially at the youngest ages.⁷² Table TC.7.8 presents the percentage of children aged 0–23 months who were bottle-fed with a nipple during the previous day.

⁷¹Table TC.7.2 is not included in this report, as data on what the child was given to drink during the first three days of life were not collected in the Jamaica 2022 MICS.

⁷²Zimmerman, E. and K. Thompson. "Clarifying Nipple confusion." *J Perinatol* 35, no.11 (2015):895-9. doi: 10.1038/jp.2015.83

- ¹ MICS indicator TC.39a - Minimum acceptable diet (breastfed children)
- ² MICS indicator TC.39b - Minimum acceptable diet (non-breastfed children)
- ³ MICS indicator TC.40 - Milk feeding frequency for non-breastfed children
- ⁴ MICS indicator TC.41 - Minimum dietary diversity
- ⁵ MICS indicator TC.42 - Minimum meal frequency

^A Minimum dietary diversity is defined as receiving foods from at least 5 of 8 food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

^B Minimum meal frequency among currently breastfeeding children is defined as children who also received solid, semi-solid, or soft foods 2 times or more daily for children age 6-8 months and 3 times or more daily for children age 9-23 months. For non-breastfeeding children age 6-23 months it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times.

^C The minimum acceptable diet for breastfed children age 6-23 months is defined as receiving the minimum dietary diversity and the minimum meal frequency, while it for non-breastfed children further requires at least 2 milk feedings and that the minimum dietary diversity is achieved without counting milk feeds.

7.8 Early childhood development

It is well recognized that a period of rapid brain development occurs during the first 1,000 days of a child's life, and the quality of children's home environment and their interactions with caregivers is a major determinant of their development during this period.⁷³ Children's early experiences with responsive caregiving serves an important neurological function as these interactions can boost cognitive, physical, social and emotional development.⁷⁴ In this context, engagement of adults in activities with children, presence of age-appropriate books and playthings in the home for the child, and the conditions of care are important indicators.

Information on a number of activities that provide children with early stimulation and responsive care were collected in the survey and presented in Table TC.10.1⁷⁵. These included the involvement of adult members of the household with children in the following activities: reading books or looking at picture books, telling stories, singing songs, taking children outside the home, compound or yard, playing with children, and spending time with children naming, counting, or drawing things. It should be noted that the questionnaire module did not include activities that children participated in with adults that are not members of their household, even if such adults are taking care of the children frequently or even daily.

Exposure to books in early years not only provides children with greater understanding of the nature of print but may also give them opportunities to see others reading, such as older siblings doing schoolwork. Reading promotes brain development, increasing imagination of children, builds language and emotional skills. Additionally, when parents/adults engage in reading with children it creates a bond between parent and child⁷⁶. The presence of books is also important for later school performance. The mothers/caretakers of all children under 5 were asked about the number of children's books or picture books they have for the child, and the types of playthings that are available at home. The findings are presented in Table TC.10.2.

Some research has found that leaving children without adequate supervision is a risk factor for unintentional injuries.⁷⁷ In MICS, two questions were asked to find out whether children age 0-59 months were left alone during the week preceding the interview, and whether children were left in the care of other children under 10 years of age. This is presented in Table TC.10.3.

7.9 Early childhood development index 2030 (ECDI2030)

Early childhood development is multidimensional and involves an ordered progression of motor, cognitive, language, socio-emotional and regulatory skills and capacities across the first few years of life.⁷⁸ While these are distinct domains of early childhood development, they are interconnected. Nurturing and supporting all these dimensions in a holistic manner is key to ensuring children have the best chance to reach their full potential. Physical growth, literacy and numeracy skills, socio-emotional development and learning readiness set the trajectory for lifelong health, learning and well-being.⁷⁹

The Early Childhood Development Index 2030 (ECDI2030) module captures the achievement of key developmental milestones by children between the ages of 24 and 59 months. The data generated by the ECDI2030 can be used for monitoring and reporting on SDG indicator 4.2.1, and to inform government efforts to improve developmental outcomes among children.

The measure includes 20 questions about the way children behave in certain everyday situations, and the skills and knowledge they have acquired, reflecting the increasing difficulty of the skills children acquire as they grow. The 20 items are organized according to the three general domains of health, learning and psychosocial well-being. Children are considered to be developmentally on track if they have achieved the minimum number of milestones expected for their age group. Each of the three general domains is composed of a set of core sub-domains:

- Health sub-domains: gross motor development, fine motor development and self-care.
- Learning sub-domains: expressive language, literacy, numeracy, pre-writing, and executive functioning.
- Psychosocial well-being sub-domains: emotional skills, social skills, internalizing behavior, and externalizing behavior.

The ECDI2030 module is not designed to report on individual domains separately. Rather, it is meant to produce a single summary score that captures the interlinked developmental concepts embedded in the three domains mentioned in SDG 4.2.1.⁸⁰

The indicator derived from the ECDI2030 module is the percentage of children aged 24 to 59 months who have achieved the minimum number of milestones expected for their age group.⁸¹

⁷⁸ UNICEF et al. *Advancing Early Childhood Development: From Science to Scale. Executive Summary, The Lancet*, 2016. https://www.thelancet.com/pb-assets/Lancet/stories/series/ecd/Lancet_ECD_Executive_Summary.pdf.

8. LEARN

8 LEARN

8.1 Early childhood education

Readiness of children for primary school can be improved through attendance to early childhood education programmes. Early childhood education programmes include programmes for children that have organised learning components, as opposed to baby-sitting and day-care which do not typically have organised teaching and learning.

Pre-primary (or early childhood education) is the first level of Jamaica's formal education system, and includes children age 3-5 years in Infant schools, Infant Departments of Primary, All Age and Primary and Junior High schools, as well as in Kindergartens and Basic schools⁸².

Table LN.1.1⁸³ shows the percent of children age 3 and 4 years currently attending pre-primary/early childhood education. A child currently attending school is a child who regularly attends school at the time of the survey. If the child is not attending school at the time of the interview due to school holidays or breaks, but the child regularly attends school, the child is considered as currently attending school. This indicator is based on question UB8 in the Questionnaire for Children Under 5.

Table LN.1.2 looks at children's exposure to organised learning programmes in the year before the official primary entry age. The official primary school entry age in Jamaica is age 6 years. Table LN.1.2 therefore refers to children who were 5 years old at the beginning of the school year.⁸⁴ In Jamaica, the school year begins in September.

The indicator corresponds to SDG indicator 4.2.2: Participation rate in organized learning (one year before the official primary entry age) and is calculated as an adjusted⁸⁵ net attendance rate (ANAR). This indicator is based on question UB7 in the Questionnaire for Children Under 5.

Additionally, Table LN.1.2 presents the gender, wealth and area parity indices for SDG indicator 4.2.2. These indices contribute to SDG indicator 4.5.1: Parity indices (female/male, rural/urban, bottom/top wealth quintile and others such as disability status, indigenous peoples and conflict-affected, as data become available) for all education indicators that can be disaggregated. Generally, when a parity index value falls between 0.97 and 1.03, it is regarded as parity between two groups. The likely more disadvantaged group (e.g., female, poor and rural) is placed in the numerator, so parity index values below 0.97 indicate disadvantage for those groups. For example, in the gender parity index (GPI), a value between 0.97 and 1.03 indicates parity between the sexes, a GPI value lower than 0.97 indicates female disadvantage and a value greater than 1.03 suggests male disadvantage. The further from 1.00 that a parity index lies, the greater the disparity between groups. The indices do not reveal the overall indicator levels, as parity may be achieved, while overall levels for both groups are low.

Parity indices are also presented in Table LN.2.8 (for attendance to primary, lower and upper secondary school) and in Tables LN.4.1 and LN.4.2 (for reading and numeracy skills, respectively).

⁸²Basic schools are public-private early childhood institutions, owned by the church or community, whose operations receive assistance in the form of grants and or subsidies from the Government of Jamaica. Ministry of Education. *Education Statistics 2015-2016: Annual Statistical Review of the Education Sector*. Kingston, Jamaica.

⁸³In the background characteristics in this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent: Mothers (or caretakers, interviewed only if the mother is deceased or is living elsewhere).

⁸⁴In MICS, the age of household members is the age at the time of the survey. This determines eligibility for individual questionnaires, modules and questions. Age is also used to define indicators. However, in analysis of the majority of education-related indicators based on the age of children, e.g., adjusted net attendance rates, completion rates, etc., a variable is created to reflect the age at the beginning of the school year. This eliminates issues relating to the timing and length of survey fieldwork and creates comparable findings across countries, while taking age-criteria for enrolment into account. Tables in this chapter specifically mention "Age at beginning of school year" in rows and columns where applicable, as compared to simply "age" in reference to age at the time of the survey.

⁸⁵Rates presented in this table are "adjusted" since the numerator includes children one year younger than the official primary entry age attending either ECE or primary education.

8.2 Attendance

Ensuring that all girls and boys complete primary and secondary education is a target of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Jamaica, children enter primary school at age 6, lower secondary at age 12 and upper secondary school at age 15. There are 6 grades in primary school, 3 grades in lower secondary school and 2 grades in upper secondary school. In primary school, grades are referred to as grade 1 to grade 6. For lower secondary school, grades are referred to as grade 7 to grade 9 (or first form to third form), and in upper secondary school grades are referred to as grade 10 to grade 11 (or fourth form to fifth form). The school year typically runs from September of one year to the end of June/first week of July of the following year.

To achieve comparability between varying national educational systems and classifications across the world, the United Nations Educational, Scientific and Cultural Organization (UNESCO) maintains the International Standard Classification of Education (ISCED) statistical framework. Its defined levels and coding are used in computation of MICS Indicators.⁸⁶ With focus on completion of primary and secondary education, indicators are centred on levels 0-3 presented in the table of classifications below.

ISCED 2011		Education system in Jamaica
Level	ISCED Name	Name of education level in English
0	Early childhood education and care	Pre-primary
1	Primary	Primary education
2	Lower secondary	Lower secondary education
3	Upper secondary	Upper secondary education
The post-secondary level 4-8 are not detailed in this table, but include 4: Post-secondary non-tertiary, 5: Short-cycle tertiary, 6: Bachelor's or equivalent, 7: Master's or equivalent, and 8: Doctoral or equivalent		

Attendance to pre-primary education is important for the readiness of children to school. Table LN.2.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended an early childhood education programme the previous year.⁸⁷

Table LN.2.2 presents the percentage of children of primary school entry age entering grade 1.

Table LN.2.3 provides the percentage of children of primary school age (6 to 11 years) who are attending primary or secondary school⁸⁸, and those who are out of school. Similarly, Table LN.2.4 presents the percentage of children of lower secondary school age (age 12 to 14 years) who are attending lower secondary school or higher education levels⁸⁹, and those who are out of school.

In Table LN.2.5, children are distributed according to their age against current grade of attendance (age-for-grade). For example, an 8-year-old child (at the beginning of the school year) is expected to be in grade 3, as per the official intended age-for-grade. If this child is currently in grade 1, he/she will be classified over-age by 2 years. The table includes both primary and lower secondary levels.

⁸⁶ ISCED is periodically revised by UNESCO (latest in 2011) in consultation with countries. National ISCED mappings are published here: <http://uis.unesco.org/en/isced-mappings>.

⁸⁷ The computation of the indicator does not exclude repeaters, and therefore is inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre-primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

⁸⁸ Rates presented in this table are "adjusted" since they include not only primary school attendance, but also lower and upper secondary school attendance in the numerator.

⁸⁹ Rates presented in this table are "adjusted" since they include not only lower secondary school attendance, but also attendance to higher education levels in the numerator.

Table LN.2.6 presents the percentage of children of upper secondary school age (age 15 to 16 years) who are attending upper secondary school or higher⁹⁰, and those who are out of school.

The gross intake ratio to the last grade of primary school, primary school completion rate and transition rate to secondary education are presented in Table LN.2.7. The gross intake ratio is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

The completion rate of primary education refers to the percentage of a cohort of children age 3 to 5 years above the official intended age for the last grade of primary education who have completed primary education. The intended age for the last grade of primary is the age at which children would enter the last grade of primary school if they had started school at the official primary entry age and had progressed without repeating or skipping a grade. In Jamaica, the official age of entry into primary school is age 6 years. With 6 grades in primary school, the intended age for the last grade of primary is therefore 11 years, and the reference group for the completion rate of primary education is children age 14 to 16 years. Completion rates are also presented for lower and upper secondary education. The official intended age for the last grades of lower and upper secondary school are 14 and 16 years, respectively. Thus, denominators for the lower and upper secondary completion rates are children age 17 to 19 years and children age 19 to 21 years, respectively.

The table also provides the “effective” transition rate⁹¹, defined as the percentage of children who continued to the next level of education – the number of children who are attending the first grade of the higher education level in the current school year and were in the last grade of the lower education level the previous year divided by the number of children who were in the last grade of the lower education level the previous school year and are not repeating that grade in the current year.

A low effective transition rate indicates that a low percentage of students are transitioning to the next level of education. This brings to light the existence of potential barriers in an education system including: financial burden such as enrolment fees or the obligation to purchase textbooks or school uniforms; education supply and quality issues such as a limited number of teachers or classrooms and low-quality teaching; as well as social and individual beliefs on education such as low expectation in returns of advancing in education.

Table LN.2.8 presents the gender parity indices for the adjusted primary and secondary net attendance rates provided in Tables LN.2.3, LN.2.4 and LN 2.6. It also presents additional parity indices contributing to SDG 4.5.1, as described for Table LN.1.2.

Specifically, the orphanhood parity index accommodates the need for continuing presentation of data related to the previous MDG indicator 6.4. It should be noted that this indicator was measured on the age group of 10-14 years alone, whereas this replacing measure is on attendance for each of the three levels of education presented. However, due to the small unweighted sample of orphans, the orphanhood parity index has been suppressed.

In response to the COVID-19 pandemic, which necessitated the closure of physical classrooms in March 2020 as part of the Jamaican government’s public health measures, where possible, some classes were held through virtual platforms such as Zoom, Google and Teams. The online modality was one of the main methods of teaching delivery, starting as early as the third term (April to June) of the 2019-2020 school year. This modality became part of the blended approach to learning which was officially rolled out across the country in October 2020 at the (delayed) start of the 2020-2021 school year, and which continued into early 2022 before the start of the MICS. Several challenges to the success of this teaching modality emerged, such as access to appropriate devices and access to internet service at home. Table LN.2.9 presents the percentage of children age 5-17 years who, since the start of the current school year (2021 to 2022), has attended online learning, has access to internet at home, and has exclusive access to a device such as a computer or laptop to facilitate school attendance.

⁹⁰ Rates presented in this table are “adjusted” since they include not only upper secondary school attendance, but also attendance to higher education levels in the numerator.

⁹¹ The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils’ progression to secondary school as it assumes that the repeaters never reach secondary school.

Table LN.2.1: School readiness

Percentage of children attending the first grade of primary school who attended an early childhood education programme during the previous school year, Jamaica MICS, 2022

8.3 Parental involvement

Parents' involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.⁹² Research also shows that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.⁹³

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, attending school meetings and volunteering in schools) can also benefit a student's performance.⁹⁴ Research studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.⁹⁵

The Parental Involvement module included in the Questionnaire for children age 5-17 years was developed and tested for inclusion in MICS6. The work is described in detail in MICS Methodological Papers, No. 5.⁹⁶

Table LN.3.1 presents percentages of children age 7-14 years for whom an adult household member received a report card and was involved in school management and school activities in the last year, including discussion with teachers on children's progress.

In Table LN.3.2 reasons for children unable to attend class due to a school-related reason are presented. Reasons include natural and man-made disaster, teacher strike and teacher absenteeism.

Lastly, Table LN.3.3 shows learning environment at home, i.e., percentage of children with 3 or more books to read, percentage of children who have homework, percentage whose teachers teach in the language that the child speaks at home, and percentage of children who receive help with homework.

¹ MICS indicator LN.12 - Availability of information on children's school performance

² MICS indicator LN.13 - Opportunity to participate in school management

³ MICS indicator LN.14 - Participation in school management

⁴ MICS indicator LN.15 - Effective participation in school management

⁵ MICS indicator LN.16 - Discussion with teachers regarding children's progress

^a A As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^b Attendance to school here is not directly comparable to adjusted net attendance rates reported in preceding tables, which utilise information on all children in the sample. This and subsequent tables present results of the Parental Involvement and Foundational Learning Skills modules administered to mothers or caretakers of a randomly selected subsample of children age 7-14 years.

^c School management sector was collected for children attending primary education or higher. Children out of school or attending ECE are not shown.

na: not applicable

(*) Figures that are based on fewer than 25 unweighted cases

Table LN.3.2: School-related reasons for inability to attend class

Percentage of children age 7-14 years not able to attend class due to absence of teacher or school closure, by reason for inability, and percentage of adult household members contacting school officials or governing body representatives on instances of teacher strike or absence, Jamaica MICs, 2022

¹ MICS indicator LN.18 - Availability of books at home

² MICS indicator LN.19 - Reading habit at home

³ MICS indicator LN.20 - School and home languages

⁴ MICS indicator LN.21 - Support with homework

^A This table utilises information collected in both the Parental Involvement and Foundational Learning Skills modules. Note that otherwise identical denominators may be slightly different, as the Foundational Learning Skills module includes consent of respondent to interview child and assent and availability of child to be interviewed. This invariably reduces the number of cases for data collected in this module.

^B As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

na: not applicable

(*) Figures that are based on fewer than 25 unweighted cases

() Figures that are based on 25-49 unweighted cases

8.4 Foundational learning skills

The ability to read and understand a simple text is one of the most fundamental skills a child can learn. Yet in many countries, students enrolled in school for as many as 6 years are unable to read and understand simple texts, as shown for instance by regional assessments such as the Latin American Laboratory for Assessment of the Quality of Education (LLECE), the Analysis Programme of the CONFEMEN Education Systems (PASEC) and the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ).⁹⁷ Acquiring literacy in the early grades of primary school is crucial because doing so becomes more difficult in later grades, for those who are lagging behind.⁹⁸

A strong foundation in basic numeracy skills during the early grades is crucial for success in mathematics in the later years. Mathematics is a skill very much in demand and most competitive jobs require some level of skill in mathematics. Early mathematical knowledge is a primary predictor of later academic achievement and future success in mathematics is related to an early and strong conceptual foundation.⁹⁹

There are a number of existing tools for measuring learning outcomes¹⁰⁰ with each approach having their own strengths and limitations as well as varying levels of applicability to household surveys such as MICS. For some international assessments, it may just be too late: "Even though international testing programs like PISA and TIMSS are steadily increasing their coverage to also cover developing countries, (...) much of the divergence in test scores happens before the points in the educational trajectories of children where they are tested by international assessments", according to longitudinal surveys like the Young Lives Study.¹⁰¹ National assessments such as the Early Grade Reading Assessment, which happens earlier and is more context specific, will however be less appropriate for cross-country analysis; although it may be possible to compare children who do not complete an exercise (zero scores) set at a level which reflects each national target for children by a certain age or grade. Additionally, it is recognised that some assessments only capture children in school. However, given that some children do not attend school, further data on these out-of-school children is needed and these can be adequately captured in household surveys.

The MICS Foundational Learning Skills module is designed to measure basic reading and numeracy skills expected upon completion of the second grade of primary education.

The reading skills assessment is based on a short story and five comprehension questions (three literal and two inferential). The rationale, development, testing and validation of this module has been documented in two MICS Methodological Papers, No. 595 and No. 9¹⁰².

In the Jamaica 2022 MICS, the reading assessment was available in English. The assessment tool was customised using the official Grade 2 textbooks, ensuring that the vocabulary was appropriate for Grade 2 learners, both in terms of complexity and cultural relevance.¹⁰³

While the official language of Jamaica is English, many children first learn to speak Patois¹⁰⁴, a largely unwritten Jamaican dialect. Children were asked what language they mostly speak at home (home language) and children who had ever attended school were also asked what language is or was used most often for teaching in class (school language). The decision about whether to administer the reading assessment was based on whether English was the child's home and/or school language:

- Children whose school or home language was mainly English were given the reading assessment.
- Children whose school and home language was other than English, were not given the reading assessment.
- Children who had never attended school and whose home language was other than English, were not given the reading assessment.

The numeracy skills assessment is based on universal skills expected at Grade 2 level. The tool includes four mathematics tasks: number reading, number discrimination, addition and pattern recognition.

Tables LN.4.1 and LN.4.2 present percentages of children age 7-14 years, by sex, who correctly answered foundational reading tasks and numeracy skills, respectively. Age and school attendance, by level and grade are among the disaggregates shown and necessary to read some of the reported indicators. These MICS indicators are designed and developed to both inform national policy development and report on global SDG indicator 4.1.1(a): Proportion of children in grade 2/3 achieving a minimum proficiency in (i) reading and (ii) mathematics by sex.

The assessment score of reading tasks is further disaggregated by results of the literal questions and inferential questions. The disaggregation of numeracy skills such as number reading, number discrimination, addition and pattern recognitions are also available.

¹ MICS indicator LN.22a - Foundational reading and numeracy skills (reading, age 7-14)

² MICS indicator LN.22b - Foundational reading and numeracy skills (reading, age for grade 2/3)

³ MICS indicator LN.22c - Foundational reading and numeracy skills (reading, attending grade 2/3); SDG indicator 4.1.1

⁴ MICS indicator LN.11a - Parity indices - reading, age 7-14 (gender); SDG indicator 4.5.1

⁵ MICS indicator LN.11a - Parity indices - reading, age for grade 2/3 (gender); SDG indicator 4.5.1

⁶ MICS indicator LN.11a - Parity indices - reading, attending grade 2/3 (gender); SDG indicator 4.5.1

⁸ MICS indicator LN.11c - Parity indices - reading, age 7-14 (area); SDG indicator 4.5.1

⁷ MICS indicator LN.11b - Parity indices - reading, age 7-14 (wealth); SDG indicator 4.5.1

⁹ MICS indicator LN.11d - Parity indices - reading, age 7-14 (functioning); SDG indicator 4.5.1

^A The reading tasks were available in English. Children were assessed in the language (mainly) spoken by teachers or alternatively in the language (mainly) spoken at home. Children for whom both indicated languages were not available for assessment are recorded here.

^B As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

na: not applicable

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

[†] denotes 0 unweighted case in the denominator

9. PROTECTED FROM VIOLENCE AND EXPLOITATION

9.1 Birth registration

A name and nationality are every child's right, enshrined in the Convention on the Rights of the Child (CRC) and other international treaties. Registering children at birth is the first step in securing their recognition before the law, safeguarding their rights, and ensuring that any violation of these rights does not go unnoticed.¹⁰⁵ Birth certificates are legal documentation of birth registration and the first form of legal identity, and are often required to access health care or education. Having legal identification can also be one form of protection from entering into marriage or the labour market, or being conscripted into the armed forces, before the legal age. Birth registration and certification are also legal proof of one's place of birth and family ties and thus necessary to obtain a passport. In adulthood, birth certificates may be required to obtain social assistance or a job in the formal sector, to buy or inherit property and to vote.

In Jamaica, it is mandated by The Registration (Births and Deaths) Act, 1889 that every birth be registered with the Registrar General's Department (RGD) within the first six weeks. Birth registrations are currently done 'at the bedside' by RGD officers, when the birth occurs in a hospital or birthing centre, and attracts a minimal fee of J\$200.00. Since January 2007, every child receives a complimentary birth certificate, with each additional copy attracting a fee. For births that occur outside of the hospital/birthing centre, if the birth is registered with the Local District Registrar within the first year of life, only the registration fee of J\$200.00 is applicable. However, births that are registered after a year attracts a registration fee of J\$300.00, in addition to a late processing fee.¹⁰⁶

Table PR.1.1 shows the percentage of children under age 5 whose births have been registered, and those who have a birth certificate. The small sample of unweighted cases does not allow reliable disaggregation for the less than one percent of children whose births have not been registered.

9.2 Child discipline

Teaching children self-control and acceptable behaviour is an integral part of child discipline in all cultures. Positive parenting practices involve providing guidance on how to handle emotions or conflicts in manners that encourage good judgment and responsibility and preserve children's self-esteem, physical and psychological integrity and dignity. Too often however, children are reprimanded using punitive methods that rely on the use of physical force or verbal intimidation/psychological aggression to obtain desired behaviours. Studies¹⁰⁷ have found that exposing children to violent discipline has harmful consequences, which range from immediate impacts to long-term harm that children carry forward into adult life. Violence hampers children's development, learning abilities and school performance; it inhibits positive relationships, provokes low self-esteem, emotional distress and depression; and, at times, it leads to risk taking and self-harm.

Psychological aggression refers to the action of shouting, yelling or screaming at a child, as well as calling a child an offensive name such as 'dumb', 'lazy' or 'wutliss'. Physical (or corporal) punishment is an action intended to cause physical pain or discomfort, but not injuries. Physical punishment is defined as shaking the child, hitting or slapping him/her on the hand/arm/leg, hitting him/her on the bottom or elsewhere on the body with a hard object, spanking or hitting him/her on the bottom with a bare hand, hitting or slapping him/her on the face, head or ears, and beating him/her over and over as hard as possible. Pinching the child and twisting his/her ear were also considered in the Jamaica MICS.

The nonviolent disciplinary practices included in the Child Discipline module are: 1) explaining why a behaviour is wrong, 2) taking away privileges or not allowing him/her to leave the house, and 3) giving him/her something else to do.

In the Jamaica 2022 MICS, mothers or caretakers of children under age five and of one randomly selected child aged 5-17 were asked a series of questions on the methods adults in the household used to discipline the child during the past month and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.2.1 and PR.2.2 present the results.

9.3 Child labour

Children around the world are routinely engaged in paid and unpaid forms of work that are not harmful to them. However, they are classified as child labourers when they are either too young to work or are involved in hazardous activities that may compromise their physical, mental, social or educational development. According to Article 32 (1) of the CRC, "States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development".

In October 2003, Jamaica ratified ILO Conventions 138 (Minimum Age of Employment) and 182 (Worst forms of Child Labour)¹⁰⁸. The provisions of these Conventions are enforceable under the 2004 Child Care and Protection Act, Sections 33-35, which makes it illegal to employ children under 13 years. Additionally, children age 13-14 years may only be employed in light work, while only children age 15 years and older may be formally employed¹⁰⁹. The Ministry of Labour and Social Security has responsibility for implementing the National Plan of Action on Child Labour.

The child labour module was administered for one randomly selected child age 5-17 years in each household and includes questions on the type of work a child does and the number of hours he or she is engaged in it. Data are collected on both economic activities (paid or unpaid work for someone who is not a member of the household, or work for a family farm or business) and domestic work (household chores such as cooking, cleaning or caring for children, as well as collecting firewood or fetching water).^{110,111,112}

Table PR.3.1 presents children's involvement in economic activities. The methodology of the MICS Indicator on Child labour uses three age-specific thresholds for the number of hours children can perform economic activity without being classified as child labourers. A child that performed economic activities during the last week for more than the age-specific number of hours as follows is classified as being in child labour:

- i. age 5-11: 1 hour or more
- ii. age 12-14: 14 hours or more
- iii. age 15-17: 43 hours or more

Table PR.3.2 presents children's involvement in household chores. As for economic activity above, the methodology also uses age-specific thresholds for the number of hours children can perform household chores without being classified as child labourers. A child that performed household chores during the last week for more than the age-specific number of hours is classified as being engaged in child labour.¹¹³

- i. age 5-11 and age 12-14: 21 hours or more
- ii. age 15-17: No limit to number of hours

¹⁰⁸ [HTTPS://WWW.MLSS.GOV.JM/DEPARTMENTS/CHILD-LABOUR/](https://www.mlss.gov.jm/departments/child-labour/) . Retrieved 02.02.2023.

¹⁰⁹ [HTTPS://LAWS.MOJ.GOV.JM/LIBRARY/STATUTE/THE-CHILD-CARE-AND-PROTECTION-ACT](https://laws.moj.gov.jm/library/statute/the-child-care-and-protection-act) . Retrieved 02.02.2023.

¹¹⁰ 'Own use production of goods', including activities such as fetching water and collecting firewood, falls within the production boundary set by the United Nations System of NationalAccounts. However, for the purpose of SDG reporting of indicator 8.7.1, and with the goal of facilitating international comparability, fetching water and collecting firewood have been classified as unpaid household services (i.e., household chores), a form of production that lies outside the production boundary.

¹¹¹ UNICEF. *How Sensitive Are Estimates of Child Labour to Definitions?*. MICS Methodological Paper No. 1. New York: UNICEF, 2012. [HTTPS://DATA.UNICEF.ORG/WP-CONTENT/UPLOADS/2015/12/CHILD_LABOUR_PAPER_NO.1_FINAL_162.PDF](https://data.unicef.org/wp-content/uploads/2015/12/CHILD_LABOUR_PAPER_NO.1_FINAL_162.PDF).

¹¹² The Child Labour module was administered in the Questionnaire for Children Age 5-17 (See Appendix E: Questionnaires). In households with at least one child age 5-17, one child was randomly selected. To account for the random selection, the household sample weight is multiplied by the total number of children age 5-17 in each household; this weight is used when producing the relevant tables.

¹¹³ Note that the age-specific thresholds for household chores have changed during the implementation of the sixth round of MICS. Comparison to other data sources, including previous MICS surveys, should be done with caution.

SDG Target 8.7 aims to “take immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms.” The SDG indicator 8.7.1 provides the proportion of children aged 5-17 years who are engaged in child labour. Two measures of the indicator are presently in use, the first based on the production boundary set by the United Nations System of National Accounts (using above age-thresholds on economic activities alone) and the second based on the general production boundary (classifying as child labour if age-specific thresholds are exceeded on either or both economic activities or household chores). Table PR.3.3 presents both of these two measures. The MICS Indicator PR.3 is based on the second, i.e., using the general production boundary.

Pertaining to the overall concept of child labour, the module also collects information on hazardous working conditions. Table PR.3.4 presents the percentage of children involved in each of the hazardous activities included in the survey. Note, however, that the present definition, also used for SDG reporting, does not include involvement in hazardous working conditions, as further methodological work is needed to validate questions specifically aimed at identifying children working under such hazardous conditions.

^A Note that the threshold of number of hours was changed during MICS6 implementation, due to a change in the SDG indicator definition: From 28 to 21 hours for both children age 5-11 and 12-14 years. In the new definition, there is no longer a maximum number of hours for chores of children age 15-17 years.

^B Includes attendance to early childhood education

9.4 Child marriage

Marriage¹¹⁴ before the age of 18 is a violation of human rights, yet remains a reality for many children. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys, but does occur around the world among children of both sexes. The impacts specific to boys married in childhood are not yet well understood, but marriage does place boys in an adult role accompanied by responsibilities for which they may not be prepared.

In many parts of the world, parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.¹¹⁵

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and are less likely to receive maternal health care services.^{116,117} In addition, pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Table PR.4.1W presents the percentage of women married before ages 15 and 18 years, the percentage of adolescent girls age 15-19 years who are currently married, and the percentage of women in a polygynous union.

Table PR.4.2W presents, respectively, the proportion of women who were first married or entered into a marital union before age 15 and 18 by area and age groups. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Another component is the spousal age difference with the indicator being the percentage of married/in union women 10 or more years younger than their current spouse. Table PR.4.3 presents the results of the age difference between women and their husband or partner.

¹¹⁴ All references to marriage in this chapter include cohabiting unions, as well as visiting partner relationships.

9.5 Victimization

Crime can have a large impact on the lives of victims and the wider community in which they live. Those who are victims of crimes can suffer physically and psychologically and experience loss of assets and income. Crime can also carry significant economic costs to the community through the provision of preventative measures as well as corrective services¹¹⁸.

Table PR.6.1W¹¹⁹ presents the percentage of women who were victims of robbery or assault in the last 3 years and 1 year prior to the survey, by various background characteristics. Table PR.6.2W shows whether weapons (namely, knife, gun or other weapons) were used during the last robbery. Table PR.6.3W expands on the circumstances of the latest assault, indicating where it took place and the type of weapon used. Finally, Table PR.6.4W indicates whether the last robbery or assault experienced by women was reported to the police.

¹¹⁸ United Nations Office on Drugs and Crime, and United Nations Economic Commission for Europe. *Manual on Victimization Surveys*. Geneva: UN. [HTTPS://WWW.UNODC.ORG/DOCUMENTS/-DATA-AND-ANALYSIS/CRIME-STATISTICS/MANUAL_ON_VICTIMIZATION_SURVEYS_2009_WEB.PDF](https://www.unodc.org/documents/-data-and-analysis/crime-statistics/manual_on_victimization_surveys_2009_web.pdf).

¹¹⁹ Tables PR.5, which present data on female genital mutilation, have been omitted from this report, as the topic is not relevant for Jamaica and was not included in the Jamaica 2022 MICS.

¹ 1 MICS indicator PR.13 - Crime reporting; SDG indicator 16.3.1

^A This indicator is constructed using both last incidents of robbery and assault, as respondents may have experienced 1) no incident, 2) one last incident of either robbery or assault or 3) both robbery and assault.

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

'-' denotes 0 unweighted case in the denominator

9.6 Feelings of safety

Questions about fear, such as feelings of safety and perceptions of crime as a problem, indicate respondents' level of perceived safety in everyday life. This is important as such perceptions limit people's freedom of movement and influence how they manage threats to their safety¹⁴.

Table PR.7.1W present data for women on their feelings of safety for walking alone in their neighbourhood after dark and for being at home alone after dark.

Table PR.7.1W: Feelings of safety (women)

Percent distribution of women age 15-49 years by feeling of safety walking alone in their neighbourhood after dark and being home alone after dark, Jamaica MICS, 2022

	Percent distribution of women who walking alone in their neighbourhood after dark feel:					Total	Percentage of women who feel safe walking alone in their neighbourhood after dark ¹	Percent distribution of women who being home alone after dark feel:					Total	Percentage of women who feel safe home alone after dark	Percentage of women who after dark feel very unsafe walking alone in their neighbourhood or being home alone	Number of women

9.7 Attitudes towards domestic violence

The Jamaica 2022 MICS assessed the attitudes of women age 15-49 years towards wife/partner beating by asking the respondents whether they think that husbands/partners are justified to hit or beat their wives/partners in a variety of situations. The purpose of these questions was to capture the social justification of violence (in contexts where women have a lower status in society) as a disciplinary action when a woman does not comply with certain expected gender roles. The responses to these questions can be found in Table PR.8.1W.

Table PR.8.1W: Attitudes toward domestic violence (women)

**10. LIVE IN A SAFE AND
CLEAN ENVIRONMENT**

10 LIVE IN A SAFE AND CLEAN ENVIRONMENT

10.1 Drinking water

Access to safe drinking water, sanitation and hygiene (WASH) is essential for good health, welfare and productivity and is widely recognised as a human right¹²⁰. Inadequate WASH is primarily responsible for the transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. Diarrhoeal diseases exacerbate malnutrition and remain a leading global cause of child deaths.

Drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development. While improving water quality is critical to prevent disease, improving the accessibility and availability of drinking water is equally important, particularly for women and girls who usually bear the primary responsibility for carrying water, often for long distances.¹²¹

The SDG targets relating to drinking water are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.1). For more information on global targets and indicators please visit the website of the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.¹²²

The distribution of the population by main source of drinking water is shown in Table WS.1.1. The population using improved sources of drinking water are those using any of the following types of supply: piped water (into dwelling, compound, yard or plot, to neighbour, public tap/standpipe), tube well/borehole, protected dug well, protected spring, rainwater collection, and packaged or delivered water.¹²³

Table WS 1.2 shows the amount of time taken per round trip to collect water for users of improved and unimproved sources. Household members using improved water sources located on premises or requiring up to and including 30 minutes per trip for water collection meet the SDG criteria for a 'basic' drinking water service.

Table WS.1.3 presents the sex and age of the household member usually responsible for water collection among household members without water sources on premises. Table WS 1.4 shows the average time spent collection water each day by the household member mainly responsible for collecting drinking water.

Table WS.1.5 shows the proportion of household members with sufficient water available when needed from their main source of drinking water and the main reasons household members are unable to access water in sufficient quantities when needed.

Table WS.1.9¹²⁴ presents the main methods by which households report treating water in order to make it safer to drink. Boiling water, adding bleach or chlorine, using a water filter, and using solar disinfection are considered appropriate methods of water treatment.

¹²⁰ The human rights to water and sanitation were explicitly recognised by the UN General Assembly and Human Rights Council in 2010 and in 2015.

¹²¹ WHO, and UNICEF. *Safely Managed Drinking Water: thematic report on drinking water*. Geneva: WHO Press, 2017. 10.2 Handwashing

Handwashing with water and soap is the most cost-effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five¹²⁵. It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and before feeding a child. Direct observation of handwashing behaviour at these critical times is challenging. A reliable alternative to observations is assessing the likelihood that correct handwashing behaviour takes place by asking to see the place where people wash their hands and observing whether water and soap (or other local cleansing materials) are available at this place^{126,127}

Hygiene was omitted from the MDGs but has been included in the SDG targets which aim to achieve universal access to a basic handwashing facility at home (SDG 1.4 and 6.2).

Table WS.2.1 shows the proportion of household members with fixed or mobile handwashing facilities observed on premises (in the dwelling, yard or plot). It also shows the proportion of handwashing facilities where water and soap were observed. Household members with a handwashing facility on premises with soap and water available meet the SDG criteria for a 'basic' handwashing facility¹²⁸.

¹²⁵ Cairncross, S. and V. Valdmanis. "Water supply, sanitation and hygiene promotion Chapter 41." in *Disease Control Priorities in Developing Countries. 2nd Edition*, edited by Jameson et al. Washington (DC): The International Bank for Reconstruction and Development / The World Bank.

¹²⁶ Ram, P. *Practical Guidance for Measuring Handwashing Behavior: 2013 Update*. Global Scaling Up Handwashing. Washington DC: World Bank Press, 2013.

¹²⁷ Handwashing place or facilities may be fixed or mobile and include a sink with tap water, buckets with taps, tippy-taps, and jugs or basins designated for handwashing. Soap includes bar soap, liquid soap, powder detergent, and soapy water but does not include ash, soil, sand or other handwashing agents.

¹²⁸ The methodology for calculating the indicator place focus on those households where the place for handwashing and the presence of soap and water was observed. It should be noted however that the households which refused to give permission for the interviewer to observe the place for handwashing are oftentimes located in exclusive and more well-off communities, which could suggest that most likely they do have a place for handwashing and have soap and water available.

Table WS.2.1: Handwashing facility with soap and water on premises

10.3 Sanitation

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea as well as parasitic infections, such as soil-transmitted helminths (worms). Improved sanitation and hygiene can reduce diarrhoeal disease by more than a third¹²⁹, and can substantially reduce the health impact of soil-transmitted helminth infection and a range of other neglected tropical diseases which affect over 1 billion people worldwide¹³⁰.

The SDG targets relating to sanitation are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.2).

An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. Improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets. Table WS.3.1 shows the population using improved and unimproved sanitation facilities. It also shows the proportion who dispose of faeces in fields, forests, bushes, open bodies of water, beaches or other open spaces, or with solid waste, a practice known as 'open defecation'.

Table WS. 3.2 presents the distribution of household population using improved and unimproved sanitation facilities which are private, shared with other households or public facilities. Those using shared or public improved sanitation facilities are classified as having a 'limited' service for the purpose of SDG monitoring. Households using improved sanitation facilities that are not shared with other households meet the SDG criteria for a 'basic' sanitation service, and may be considered 'safely managed' depending on how excreta are managed.

Table WS.3.3 shows the methods used for emptying and removal of excreta from improved pit latrines and septic tanks. Excreta from improved pit latrines and septic tanks that is never emptied (or don't know if ever emptied) or is emptied and buried in a covered pit is classified as 'safely disposed in situ' and meets the SDG criteria for a 'safely managed' sanitation service. Excreta from improved pit latrines and septic tanks that is removed by a service provider to treatment may also be safely managed, depending on the type of treatment received. Other methods of emptying and removal are not considered 'safely managed'.

Table WS.3.5 shows the main methods used for disposal of child faeces among households with children aged 0-2 years. Appropriate methods for disposing of the stool include the child using a toilet or latrine and putting or rinsing the stool into a toilet or latrine. Putting disposable diapers with solid waste, a very common practice throughout the world, is only considered an appropriate means of disposal if there is also a system in place for hygienic collection and disposal of the solid waste itself. This classification is currently under review.

The JMP has produced regular estimates of national, regional and global progress on drinking water, sanitation and hygiene (WASH) since 1990. The JMP service 'ladders' enable benchmarking and comparison of progress across countries at different stages of development. As of 2015, updated water and sanitation ladders have been introduced which build on established indicators and establish new rungs with additional criteria relating to service levels. A third ladder has also been introduced for handwashing hygiene¹³¹. Table WS.3.6 summarises the percentages of household population meeting the SDG criteria for 'basic' drinking water, sanitation and handwashing services.

A In many countries, disposal of children's faeces with solid waste is common. The risks vary between and within countries depending on whether solid waste is regularly collected and well managed; therefore, for the purposes of international comparability, solid waste is not considered safely disposed.

11. EQUITABLE CHANCE IN LIFE

11.1 Child functioning

The Convention on the Rights of Persons with Disabilities¹³² outlines States Parties' obligations to ensure the full realization of rights for children with disabilities on an equal basis with other children. The presence of functional difficulties may place children at risk of experiencing limited participation in a non-inclusive environment, as well as limit the fulfilment of their rights.

The Jamaica 2022 MICS included child functioning modules intended to provide an estimate of the number/proportion of children with functional difficulties as reported by their mothers or primary caregivers. The module included in the Questionnaire for Children Under Five covered children between 2 and 4 years of age while a similar module was included in the Questionnaire for Children age 5-17 years.

Functional domains covered in the Questionnaire for Children Under Five are as follows: Seeing, hearing, walking, fine motor, communication, learning, playing, and controlling behaviour while functional domains covered in the Questionnaire for Children Age 5-17 are as follows: Seeing, hearing, walking, self-care, communication, learning, remembering, concentrating, accepting change, controlling behaviour, making friends, anxiety, and depression

Tables EQ.1.1 and EQ.1.2 present the percentage of children by age group with functional difficulty by domain.

Table EQ.1.3 presents the percentage of children age 2-17 who use assistive devices and still have difficulty within the relevant functional domains.

Table EQ.1.4 is a summary table presenting the percentage of children by age group with functional difficulty.

¹³² "Convention on the Rights of Persons with Disabilities." United Nations. Accessed August 31, 2018. ^A Functional difficulty for children age 2-4 years are defined as having responded "A lot of difficulty" or "Cannot at all" to questions within all listed domains, except the last domain of controlling behaviour, for which the response category "A lot more" is considered a functional difficulty.

^B Children age 2 are excluded, as early childhood education attendance is only collected for age 3-4 years.

(*) Figures that are based on fewer than 25 unweighted cases

11.2 Social transfers

Social protection is the set of public and private policies and programmes aimed at preventing, reducing and eliminating economic and social vulnerabilities to poverty and deprivation. Increasing volatility at the macro and household level, the persistence of inequalities and exclusion, threats posed to sustainable development by climate change and changing population trends have heightened the relevance and political momentum for social protection globally.¹³³

Social transfers or external economic support can be defined as predictable direct transfers to individuals or households, both in-kind and cash (including cash for work and public work programmes) to protect and prevent individuals and households from being affected by shock and support the accumulation of human, productive and financial assets and includes various social protection schemes – examples in Jamaica include bi-monthly conditional cash transfers, other types of cash grants (such as for disaster rehabilitation and post-secondary education), tuition-free public schools¹³⁴ (up to secondary level), material support for education, assistance with prescription medicines for the elderly and persons with non-communicable diseases (NCDs), or any other types of ad-hoc support, excluding transfers or assistance from family members, relatives or neighbours.

Health insurance is one protection scheme and table EQ.2.1W present the percentage of women age 15-49 years who have a health insurance and among those with an insurance, the percentage insured by type of insurance. Further, tables EQ.2.2 and EQ.2.3 elaborates the existence of health insurance for children under age five and 5-17 separately.

Table EQ.2.4 presents the percentage of households who are aware of and have received external economic support, as reported by the respondent to the Household Questionnaire. The percentage of household members living in households that received social transfers or benefits in the last 3 months is further shown in Table EQ.2.5, by type of transfers and benefits. The benefits also include school tuition or school related other support available for any household member age 5-24. This table is an approximation to the SDG indicator 1.3.1 which is the proportion of population covered by social protection floors/systems.

It is well known that social and economic shocks affect the health conditions of individuals and undermine household resilience. These shocks affect the capacity of families to care for their children and place barriers to services that stand in the way of achieving goals and progress for children. In particular, poor households are vulnerable to the impacts of these shocks through the increased burden of health costs; the illness and death of household members, leading to labour constraints in the household and the further impoverishment of children who have lost one or both parents, or their primary caregiver; and other vulnerable children, causing them to drop out of school and engage in harmful child labour and other risky behaviours. As an attempt to measure coverage of social protection programmes, a global indicator, 'Proportion of the poorest households that received external economic support in the past three months', was proposed to measure the extent to which economic support is reaching households severely affected by various shocks.¹³⁵ Table EQ.2.6 presents the percentage of households in the two lowest quintiles that received social transfers or benefits in the last 3 months, by type of transfers or benefits.

¹³⁴ In Jamaica, schools in the formal public education system at the pre-primary, primary and secondary level are tuition-free. However, parents are expected to pay a fee towards administrative expenses, although the Government's policy states that no child should be excluded from school because of the parents' inability to pay these fees. At the same time, some parents opt to send their children to private schools, where tuition fees are mandatory. At the tertiary level, the government absorbs a significant portion of the cost of tuition.

¹³⁵ UNAIDS, UNICEF, and WHO. Joint United Nations Programme on HIV/AIDS, Global AIDS Response Progress Reporting 2014: Construction of core indicators for monitoring the 2011 United Nations Political Declaration on HIV and AIDS. Finally, Table EQ.2.7 presents the percentage of children under age 18 living in households that received social transfers or benefits in the last 3 months, by type of transfers or benefits, while Table EQ.2.8 presents the percentage of children and young people age 5-24 years in all households who are currently attending school and received support for school tuition and other school related support during the current school year.

11.3 Discrimination and harassment

Discrimination can impede individuals from accessing opportunities and services in a fair and equal manner. These questions are designed to measure the experiences of discrimination and harassment of respondents in the 12 months prior to the survey. The questions include specific grounds of discrimination and harassment which can increase the respondents' recollection of events. The current questions are based on a recommended set of questions available at the start of MICS6. The questions may change given that methodological development is currently underway to move the indicator from a Tier III SDG indicator classification to Tier II. Table EQ.3.1W show the percentage of women who felt discriminated against based on a number of grounds.

Table EQ.3.1W: Discrimination and harassment (women)

Percentage of women age 15-49 years who in the past 12 months have felt discriminated against or harassed and those who have not felt discriminated against or harassed, Jamaica MICS, 2022

11.4 Subjective well-being

Subjective perceptions of individuals of their incomes, health, living environments and the like, play a significant role in their lives and can impact their perception of well-being, irrespective of objective conditions such as actual income and physical health status¹³⁶.

The Jamaica 2022 MICS included a question about happiness and the respondents' overall satisfaction with life. To assist respondents in answering the question on happiness, they were shown a card with smiling faces (and not so smiling faces) that corresponded to the response categories (see the Questionnaire for Individual Women in Appendix E) 'very happy', 'somewhat happy', 'neither happy nor unhappy', 'somewhat unhappy' and 'very unhappy'. They were then shown a pictorial of a ladder with steps numbered from 0 at the bottom to 10 at the top and asked to indicate at which step of the ladder they feel they are standing at the time of the survey to indicate their level of life satisfaction. Table EQ.4.1W present the percentage of women age 15-49 years, and age 15-24 years separately, who are very or somewhat satisfied with their life overall, ladder step reported and the average life satisfaction score.

In addition to the questions on life satisfaction and happiness, respondents were also asked two simple questions on whether they think their life had improved during the last one year, and whether they think their life will be better in one year's time. Such information may contribute to the understanding of desperation that may exist among young people, as well as hopelessness and hopes for the future. Specific combinations of the perceptions during the last one year and expectations for the next one year may be valuable information to understand the general sense of well-being among young people. In Table EQ.4.2W, women's perceptions of a better life are shown.

APPENDICES

APPENDIX A SAMPLE DESIGN

The major features of the sample design are described in this appendix. Sample design features include defining the sampling frame, target sample size, sample allocation, listing in sample clusters, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the Jamaica MICS was to produce statistically reliable estimates of most indicators, at the national level, and for three regions of Jamaica: (a) the Greater Kingston Metropolitan Area (GKMA), comprising the whole of Kingston, St. Andrew urban, Spanish Town, and Portmore; (b) other urban centres (OUC); and (c) rural areas. In designing the sample for the Jamaica MICS, it was useful to review the sample design and results of the MICS conducted in 2011, documented in the Final Report of that survey.

A multi-stage, stratified cluster sampling approach was used for the selection of the survey sample. The sampling frame was based on a master sample maintained by the Statistical Institute of Jamaica for its household survey program. The master sample is based on the 2011 Population and Housing Census data and cartographic materials updated with dwelling counts and locational information from the 2019 Listing of Dwellings. The first stage selection involved the selection of Primary Sampling Units (PSUs) which are area units based on census enumeration districts (EDs). The PSUs were selected with probability proportionate to size within each stratum. The strata were the urban and rural areas within each parish. The second stage involved the systematic selection of dwellings within each selected PSU.

A.1 Sample size and sample allocation

Since the overall sample size for the Jamaica MICS partly depends on the geographic domains of analysis that are defined for the survey tables, the distribution of dwellings, EDs and PSUs from the 2011 Population and Housing Census was first examined by parish and region, GKMA, OUC and Rural strata.

The overall sample selected for the Jamaica MICS 2022 is 7800¹³⁷ households. The sampling errors for the estimates published in the last MICS report were reviewed and it was observed that, for some estimates related to children in the 0-4 age group, the coefficients of variation were above 15 per cent. For the rest of the estimates, the coefficients of variation were within acceptable limits. The number of sample children under 5 years in the last MICS was insufficient to obtain reliable estimates for some child indicators. Therefore, a larger number of sample PSUs was selected to increase the number of sample children and obtain more reliable estimates for the child indicators.

The number of households selected per cluster for the Jamaica MICS was determined as 20, based on several considerations, including the design effect, the budget available, and the time that would be needed per team to complete one cluster. Dividing the total number of households by the number of sample households per cluster, it was calculated that 390 sample clusters would need to be selected.

The distribution of the sample used in the last MICS was reviewed and a new distribution was determined. The distribution of the sample EDs and dwellings is shown below in Table SD.2.

¹³⁷ While the planned sample size was 7,800 households, multiple households were discovered by interviewers in some of the selected dwellings, which were not accounted for in the 2019 Listing of Dwellings. As per the MICS methodology, these additional households were also interviewed, which brought the total sample to 7,903 households. While it is usual to find an additional household in a few dwellings during the data collection, the timing and methodology of the Listing can impact the degree to which this happens: (a) The Listing utilized for the Jamaica 2022 MICS was done in 2019; and (b) the listing methodology used by the Statistical Institute of Jamaica recorded dwellings rather than households, as stipulated by the MICS methodology.

A.2 Selection of enumeration areas (clusters) and dwellings

The household master sample frame for the first stage of selection is based on the data and cartographic materials from the 2011 Population and Housing Census conducted by the Statistical Institute of Jamaica, updated with information from the 2019 Listing of Dwellings. During the Listing of Dwellings, entire Census Enumeration Districts (EDs) were re-enumerated to capture movements in the population after the Census along with other information to assist with the administration of surveys. All EDs in the country were classified as either urban (GKMA and OUC) or rural in the 2011 Census. The EDs were further grouped into wholly urban or wholly rural Sampling Regions (SR) using the number of dwellings from the 2011 Census as the measure of size. The sample for the 2019 Listing was comprised of primary sampling units (PSUs) selected from each sampling region with probability proportionate to size (PPS). The final master sample frame (from which the MICS sample was selected) was compiled from data collected in the 2019 Listing and stratified into three regions/strata: GKMA, OUC, Rural.

The first stage of selection for the MICS involved the selection of PSUs from the master sampling frame using PPS. The measure of size was the number of occupied dwellings from the 2019 Listing of Dwellings.

The MICS sample dwellings were selected systematically from the occupied households in the 2019 Listing of Dwellings within each PSU selected for the MICS in the previous stage 1. The MICS6 spreadsheet template for systematic random selection of households was adapted for this purpose.¹³⁸

¹³⁸ Available here: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 31, 2018. <http://mics.unicef.org/tools#survey-design>.

A.3 Calculation of sample weights

The Jamaica MICS sample is not self-weighting. Given that the sampling probabilities vary by region and cluster, it was necessary to calculate sample weights at the cluster level. These weights were used in subsequent analyses of the survey data in order to ensure that the weighted estimates reflect the distribution of the sampling frame.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample dwellings in that particular sampling stratum (h) and PSU (i):

$$W_{hi} = \frac{1}{f_{hi}}$$

The term f_{hi} , the sampling probability for the i -th sample PSU in the h -th stratum, is the product of the probabilities of selection at every stage in each sampling stratum. Given that the MICS sample PSUs were selected with PPS as a subsample of the Jamaica master sample, and the sample households were selected from the 2019 Listing of Dwellings within each sample PSU, the final probability of selection of the households for the MICS can be expressed as follows:

$$f_{hi} = \frac{n_h \times M_{hi}}{M_h} \times \frac{n'_h \times M'_{hi}}{\sum_{i \in MSh} M'_{hi}} \times \frac{m_{hi}}{M'_{hi}}$$

where:

- f_{hi} = probability of selection for the MICS sample households in the i -th sample PSU (cluster) of stratum h
- n_h = number of sample PSUs selected for Jamaica master sample in stratum h
- M_{hi} = total number of households in the i -th sample PSU of stratum h in the 2011 Jamaica Census frame
- M_h = total number of households in stratum h from the 2011 Jamaica Census frame
- n'_h = number of sample PSUs selected for the MICS subsample in stratum h from the master sample
- M'_{hi} = total number of occupied dwelling units from the 2019 Listing of Dwellings for the i -th sample PSU in stratum h (measure of size used for selecting the subsample of PSUs for the MICS with PPS)
- m_{hi} = number of households selected for the MICS in the i -th sample PSU of stratum h

Each component of this probability corresponds to an individual sampling stage. The first component is the probability of the PSU being selected with PPS for the Jamaica master sample. The second component is the probability of the sample PSU being selected with PPS in the subsample for the MICS. The denominator of this second term is the sum of the measures of size (total number of occupied dwelling units from the 2019 Listing of Dwellings) for all the master sample PSUs in stratum h (that is, the cumulated measure of size). The third term is the probability of selection for the sample households within the MICS sample cluster. The basic household weight is the inverse of this probability, and can be expressed as follows:

$$W_{hi} = \frac{1}{f_{hi}} = \frac{M_h}{n_h \times M_{hi}} \times \frac{\sum_{i \in MSh} M'_{hi}}{n'_h \times m_{hi}}$$

A final component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews by stratum, as well as the sample cluster completion rate for each stratum. The adjustment for the cluster and household non-response in each stratum is equal to:

$$\frac{1}{RR_h}$$

where RR_h is the response rate for the sample households in stratum h , defined as the proportion of the number of interviewed households in stratum h out of the number of selected households found to be occupied during the fieldwork in stratum h .

After the completion of fieldwork, response rates were calculated for each sampling stratum. These were used to adjust the sample weights calculated for each cluster. Response rates in the Jamaica Multiple Indicator Cluster Survey are shown in Table SR.1.1 in this report.

Similarly, adjustment for non-response at the individual level (women and under-5 children) for each stratum is equal to:

$$\frac{1}{RR_{qh}}$$

where RR_{qh} is the response rate for the individual questionnaires in stratum h , defined as the proportion of eligible individuals (women and under-5 children) in the sample households in stratum h who were successfully interviewed.

The non-response adjustment factors for the individual women and under-5 questionnaires were applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the list of household members in the Household Questionnaire for households where interviews were completed.

In the case of the questionnaire for children age 5-17 years, in each sample household, one child was randomly selected from all the children in this age group recorded in the list of household members, in effect a tertiary sampling unit. The household weight for the children age 5-17 years is first adjusted based on the response rate for this questionnaire at the stratum level. Once this adjusted household weight is normalised as described below, it is multiplied by the number of children age 5-17 years recorded in the list of household members. Therefore, the weights for the individual children age 5-17 years will vary by sample household. This weighting of the data for the children age 5-17 years old is implemented in the tabulation programs for the corresponding tables.

The Jamaica MICS full (raw) weights for the households were calculated by multiplying the inverse of the probabilities of selection by the non-response adjustment factor for each stratum. These weights were then standardised (or normalised), one purpose of which is to make the weighted sum of the interviewed sample units equal to the total sample size at the national level. Normalisation is achieved by dividing the full sample weights (adjusted for nonresponse) by the average of these weights across all households at the national level. This is performed by multiplying the sample weights by a constant factor equal to the unweighted number of households at the national level divided by the weighted total number of households (using the full sample weights adjusted for non-response). A similar standardisation procedure was followed in obtaining standardised weights for the individual women, children under-5 and children age 5-17 years. Adjusted (normalised) household weights varied between 0.180920 and 4.537109 in the 390 sample enumeration areas (clusters).

Sample weights were appended to all data sets and analyses were performed by weighting the data for households, women, children under-5, and children age 5-17 years with these sample weights.

APPENDIX B LIST OF PERSONNEL INVOLVED IN THE SURVEY

Implementing Agency: Planning Institute of Jamaica

Mr. Kirk Phillips	Deputy Director General, Corporate Governance & Management
Mr. Easton Williams	Senior Director, Social Policy, Planning and Research Division
Mrs. Suzette Johnson	Director, Policy Research Unit
Ms. Shadae Miller	Administrative Assistant, Policy Research Unit

UNICEF MICS Team

Ms. Olga Isaza	Representative, UNICEF Jamaica Country Office
Ms. Mariko Kagoshima	Former Representative, UNICEF Jamaica Country Office
Mr. Vicente Teran	Former Deputy Representative, UNICEF Jamaica Country Office
Mrs. Donneth Edmondson	Monitoring & Evaluation Specialist, UNICEF Jamaica Country Office
Ms. Jacqueline Montique Small	National MICS Consultant
Mr. Harry Hernandez	Regional Data Processing Consultant
Mr. Armando Levinson	Sampling Expert
Mr. David Megill	Sampling Expert
Ms. Ana Maria Restrepo	Household Survey Expert
Dr. Celia Hubert	Household Survey Expert
Mr. Jose Sierra Castillo	Former Regional MICS Coordinator
Ms. Liliana Carvajal Velez	Regional MICS Coordinator

MICS Steering and Technical Committee Members

Mr. Easton Williams	Senior Director, SPPR Division, PIOJ
Mrs. Suzette Johnson	Director, Policy Research Unit, PIOJ
Ms. Shadae Miller	Administrative Assistant, Policy Research Unit, PIOJ
Mrs. Donneth Edmondson	Monitoring & Evaluation Specialist, UNICEF JCO
Ms. Jacqueline Montique Small	National MICS Consultant, UNICEF JCO
Mrs. Mareeca Brown-Bailey	Director, Population and Health Unit, PIOJ
Ms. Ieasha Graham-McIntosh	Senior Demographer, Population and Health Unit, PIOJ
Ms. Eltonette Anderson	Health Specialist, Population and Health Unit, PIOJ
Ms. Roxine Ricketts	Education Planner, Human & Community Development Unit, PIOJ
Dr. Natalee Simpson	Director, Surveys Division, STATIN
Ms. Jessica Campbell	Director, Research Design and Evaluation Division, STATIN
Ms. Vivienne Johnson	Senior Director, Planning and Development Division, Ministry of Education, Youth & Information
Mrs. Phillipa Livingston	Senior Statistician, Ministry of Education, Youth & Information
Dr. Andriene Grant	Director, Epidemiology Research & Data Analysis Unit, Ministry of Health & Wellness
Ms. Romae Thorpe	Biostatistician, Ministry of Health & Wellness
Mrs. Daynia Maragh	Corporate Planner, Ministry of Labour & Social Security

MICS Steering and Technical Committee Members (*cont'd*)

Ms. Suzette Morris	Director of Social Security, Ministry of Labour & Social Security
Dr. Julian Devonish	Demographer & Senior Lecturer, University of the West Indies
Mr. Andre Richards	Policy/Programme Analyst, UNFPA
Dr. Tazmoye Crawford	Director, Monitoring, Evaluation & Research, Jamaica National Family Planning Board
Mr. Newton Douglas	Director, Policy Planning & Evaluation, Child Protection & Family Services Agency
Mrs. Shanakay Willison-Hudson	Research Office, Early Childhood Commission
Dr. Deanna Ashley	Executive Director, Violence Prevention Alliance (NGO)
Ms. Nardia McLaren	Acting Director, Ministry of Culture, Gender, Entertainment & Sports
Mr. Lorenzo Escondeur	Chief of Operations, Inter-American Development Bank
Ms. Ceceile Minott	Head, Caribbean Child Development Centre

Other Technical Advisors

Ms. Amanda Lee	Sampling Statistician, Statistical Institute of Jamaica
Dr. Charlton McFarlane	Chief Executive Office, Registrar General's Department
Dr. Novelette McLean-Francis	Core Curriculum Unit, Ministry of Education, Youth & Information
Dr. Melody Ennis	Ministry of Health & Wellness
Dr. Kevin Goulbourne	Director, Mental Health & Substance Abuse Services, Ministry of Health & Wellness

Expert Trainers

Ms. Jessica Campbell	Director, Research Design and Evaluation Division, STATIN
Mr. Raylon Ricketts	Statistical Institute of Jamaica
Mrs. Phillipa Livingston	Senior Statistician, Ministry of Education, Youth & Information
Dr. Novelette McLean-Francis	Core Curriculum Unit, Ministry of Education, Youth & Information
Dr. Melody Ennis	Ministry of Health & Wellness
Mrs. Elsa Marks-Willis	Ministry of Labour & Social Security
Dr. Kemisha Shaw	Ministry of Health & Wellness

Schools Facilitating Foundational Skills Training

Mona Heights Primary School - Mr. Alex Hepburn (Principal) and students
Mandeville Primary School - Mr. Howard Salmon (Principal) and students
Villa Road Primary School - Mr. Brent James (Principal) and students
Grove Primary School - Mrs. Taylor Arnette (Principal) and students

Data Collection Firm - Balcostics Limited**Data Collection - Administrative Team**

Mr. Luwayne Thomas	Team Leader/Project Manager
Mrs. Abi-Gaye Thomas	Legal & Logistics Manager
Ms. Tannecia Blackwood	Data Processing Manager
Ms. Monica White	Recruitment/Training Coordinator
Mr. Cordoan Thomas	Data Processing Officer

Data Collection - Field Supervisors

Ms. Shenoya James	Mr. Amario Morgan
Ms. Melissa Bennett	Mrs. Anna-Kay Redway-Minzie
Ms. Isheba Lambert	Ms. Sansha Lowden
Mr. Marlon Small	Ms. Chantelle White
Mrs. Tarrica Crump-Dyce	Mr. Andre Blydgen
Mrs. Sherene Valentine-Henry	Ms. Margarette Myers
Mr. Gifton Stewart	Ms. Nicola Foster
Mr. Orane Webley	

Data Collection - Interviewers

Ms. Donna-Marie Rowe	Communications Specialist, UNICEF JCO
Mr. Blessings Manda	Senior ICT Associate, UNICEF Malawi (exchange program)

APPENDIX C ESTIMATES OF SAMPLING ERRORS

The sample of respondents selected in the Jamaica Multiple Indicator Cluster Survey 2022 is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly, but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

- *Standard error (se)*: Standard error is the square root of the variance of the estimate. For survey indicators that are means, proportions or ratios, the Taylor series linearization method is used for the estimation of standard errors.
- *Coefficient of variation (se/r)* is the ratio of the standard error to the value (r) of the indicator, and is a measure of the relative sampling error.
- *Design effect (deff)* is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling based on the same sample size. The *square root of the design effect (deft)* is used to show the efficiency of the sample design in relation to the precision. A *deft* value of 1.0 indicates that the sample design of the survey is as efficient as a simple random sample for a particular indicator, while a *deft* value above 1.0 indicates an increase in the standard error due to the use of a complex sample design. If a *deft* (or *deff*) value is less than 1.0 and the corresponding number of observations is relatively small, the values of the standard error and confidence limits should be used with caution. These situations might stem from the small number of observations and the distribution of the indicator values within and between the sample clusters in such estimation domains.
- *Confidence limits* are calculated to show the interval which contains the true value of the indicator for the population, with a specified level of confidence. For MICS results 95% confidence intervals are used, which is the standard for this type of survey. The concept of the 95% confidence interval can be understood in this way: if many repeated samples of identical size and design were taken and the confidence interval computed for each sample, then 95% of these intervals would contain the true value of the indicator.

For the calculation of sampling errors from MICS data, programs developed in CSPro Version 6.3 and SPSS Version 24 Complex Samples module have been used.

The results are shown in the tables that follow. Sampling errors are calculated for SDG indicators for which SEs can be calculated, and several other MICS indicators. Definitions, numerators and denominators of each of these indicators are provided in Chapter 3. Results are presented for the national level (Table SE.1), for urban and rural areas (Tables SE.2 and SE.5), and for Greater Kingston Metropolitan Area and Other Urban Centres (Tables SE.3 and SE.4).

In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator. Given the use of normalized weights, by comparing the weighted and unweighted counts it is possible to determine whether a particular domain has been under-sampled or over-sampled compared to the average sampling rate. If the weighted count is smaller than the unweighted count, this means that the domain had been over-sampled.

For the following indicators, however, the unweighted count represents the number of sample households, and the weighted counts reflect the weighted total population living in these households.

- Access to electricity
- Primary reliance on clean fuels and technologies for cooking and lighting
- Use of basic drinking water services
- Handwashing facility with water and soap
- Use of improved sanitation facilities
- Use of basic sanitation services
- Removal of excreta for treatment off-site
- Population covered by social transfers

43	86	0.9	152	1.4					
44	101	1.0	123	1.1	Total	9,816	100.0	11,151	100.0

^A As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those shown for individuals in Tables SR.5.1W, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights. Tables DQ.1.2W, DQ.1.3 and DQ.1.4 similarly use household sample weights and do not match distributions obtained through individual questionnaires.

Table DQ.1.2W: Age distribution of eligible and interviewed women

Household population of women age 10-54 years, interviewed women age 15-49 years, and percentage of eligible women who were interviewed, Jamaica MICS, 2022

	Household population of women age 10-54 years	Interviewed women age 15-49 years		Percentage of eligible women interviewed (Completion rate)
	Number	Number	Percent	
Age

^A Those age 25 at the time of interview who were age 24 at beginning of school year are excluded as current attendance was only collected for those age 3-24 years at the time of interview

APPENDIX E JAMAICA QUESTIONNAIRES

The questionnaires of the Jamaica MICS are presented in English:

- Household Questionnaire
- Questionnaire for Individual Women
- Questionnaire for Children Under Five
- Questionnaire for Children Age 5-17

Response cards and questionnaire aids:

- Sentences for literacy testing in English
- Response card for Life Satisfaction module
- Reading & Numbers Book for Foundational Learning Skills module in English

HOUSEHOLD QUESTIONNAIRE

LIST OF HOUSEHOLD MEMBERS

HL

First complete HL2-HL4 vertically for all household members, starting with the head of the household. Once HL2-HL4 are complete for all members, make sure to probe for additional members: Those that are not currently at home, any infants or small children and any others who may not be family (such as household helpers, friends) but who usually live in the household. Then, ask questions HL5-HL20 for each member one at a time. If additional questionnaires are used, indicate by ticking this box:

HL1. Line number	HL2. First, please tell me the name of each person who usually lives here, starting with the head of the household. Probe for additional household members.	HL3. What is the relationship of (name) to (name of the head of household)?	HL4. Is (name) male or female? 1 MALE 2 FEMALE	HL5. What is (name)'s date of birth?	HL6. How old is (name)? Record in completed years. If age is 95 or above, record '95'.	HL8. Record line number if woman and age 15-49.	HL10. Record line number if age 0-4.	HL11. Age 0-17?	HL12. Is (name)'s natural mother alive?	HL13. Does (name)'s natural mother live in this household?	HL14. Record the line number of mother and go to HL16.	HL15. Where does (name)'s natural mother live?	HL16. Is (name)'s natural father alive?	HL17. Does (name)'s natural father live in this household?	HL18. Record the line number of father and go to HL20.	HL19. Where does (name)'s natural father live?	HL20. Copy the line number of mother from HL14. If blank, ask: Who is the primary caretaker of (name)? If 'No one' for a child age 15-17, record '90'.

8	2	1	4	1	2	6	4
9	1	2	1	2	3	7	5

HH26. Record the rank number (HH20), line number (HH21), name (HH22) and age (HH24) of the selected child.

RANK NUMBER __

HH27. (When HH18=1 or when there is a single child age 5-17 in the household): Record the rank number as '1' and record the line number (HL1), the name (HL2) and age (HL6) of this child from the LIST OF HOUSEHOLD MEMBERS.

LINE NUMBER __ __

NAME _____

AGE..... __ __

HH28. Issue a QUESTIONNAIRE FOR CHILDREN AGE 5-17 to be administered to the mother/caretaker of this child.

HH29. Check HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any women age 15-49?

YES, AT LEAST ONE WOMAN AGE 15-49.....1
NO2

2 ⇨ HH40

HH30. Issue a separate QUESTIONNAIRE FOR INDIVIDUAL WOMEN for each woman age 15-49 years.

HH31. Check HL6 and HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any girls age 15-17?

YES, AT LEAST ONE GIRL AGE 15-171
NO2

2 ⇨ HH40

HH32. Check HL20 in the LIST OF HOUSEHOLD MEMBERS: Is consent required for interviewing at least one girl age 15-17?

YES, AT LEAST ONE GIRL AGE 15-17 WITH HL20≠901
NO, HL20=90 FOR ALL GIRLS AGE 15-17.....2

2 ⇨ HH40

HH33. As part of the survey we are also interviewing women age 15-49. We ask each person we interview for permission. A female interviewer conducts these interviews.

For girls age 15-17 we must also get permission from an adult to interview them. As mentioned before, all the information we obtain will remain strictly confidential and anonymous.

May we interview (*name(s) of female member(s) age 15-17*) later?

- 'Yes' for all girls age 15-17 ⇒ Continue with HH40.
- 'No' for at least one girl age 15-17 and 'Yes' to at least one girl age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on individual questionnaires for those adult consent was not given. Then continue with HH40.
- 'No' for all girls age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on all individual questionnaires for whom adult consent was not given. Then continue with HH40.

HH40. Check HL10 in the LIST OF HOUSEHOLD MEMBERS: Are there any children age 0-4?	YES, AT LEAST ONE.....	1	2 ⇒ HH44A
	NO	2	
HH41. Issue a separate QUESTIONNAIRE FOR CHILDREN UNDER FIVE for each child age 0-4 years.			

MICS PLUS CONSENT

WM16. Check columns HL10 and HL20 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: Is the respondent the mother or caretaker of any child age 0-4 living in this household?

Yes ⇒ Go to WM17 in WOMAN'S INFORMATION PANEL and record '01'. Then go to the QUESTIONNAIRE FOR CHILDREN UNDER FIVE for that child and start the interview with this respondent.

No ⇒ Check HH26-HH27 in HOUSEHOLD QUESTIONNAIRE: Is there a child age 5-17 selected for QUESTIONNAIRE FOR CHILDREN AGE 5-17?

Yes ⇒ Check column HL20 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: Is the respondent the mother or caretaker of the child selected for QUESTIONNAIRE FOR CHILDREN AGE 5-17 in this household?

Yes ⇒ Go to WM17 in WOMAN'S INFORMATION PANEL and record '01'. Then go to the QUESTIONNAIRE FOR CHILDREN AGE 5-17 for that child and start the interview with this respondent.

No ⇒ Go to WM17 in WOMAN'S INFORMATION PANEL and record '01'. Then end the interview with this respondent by thanking her for her cooperation. Check to see if there are other questionnaires to be administered in this household.

No ⇒ Go to WM17 in WOMAN'S INFORMATION PANEL and record '01'. Then end the interview with this respondent by thanking her for her cooperation. Check to see if there are other questionnaires to be administered in this household.

INTERVIEWER'S OBSERVATIONS

SUPERVISOR'S OBSERVATIONS

E.1.3 Questionnaire for children under five

QUESTIONNAIRE FOR CHILDREN UNDER FIVE

Jamaica, 2022

UNDER-FIVE CHILD INFORMATION PANEL		UF
UF1. Cluster number: _____	UF2. Household number: _____	
UF3. Child's name and line number: NAME _____	UF4. Mother's / Caretaker's name and line number: NAME _____	
UF5. Interviewer's name and number: NAME _____	UF6. Supervisor's name and number: NAME _____	
UF7. Day / Month / Year of interview: _____ / _____ / <u>20</u> _____	UF8. Record the time:	HOURS : MINUTES _____ : _____

Check respondent's age in HL6 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: If age 15-17, verify that adult consent for interview is obtained (HH33) or not necessary (HL20=90). If consent is needed and not obtained, the interview must not commence and '06' should be recorded in UF17. The respondent must be at least 15 years old.

UF9. Check completed questionnaires in this household: Have you or another member of your team interviewed this respondent for another questionnaire?	YES, INTERVIEWED ALREADY 1	1 ⇒UF10B
	NO, FIRST INTERVIEW 2	2 ⇒UF10A
UF10A. Hello, my name is (<i>your name</i>). We are conducting a survey about the situation of children, families and households in Jamaica, on behalf of the Planning Institute of Jamaica. I would like to talk to you about (<i>child's name from UF3</i>)'s health and well-being. This interview will take about 20 minutes. All the information we obtain will remain strictly confidential and anonymous. If you wish not to answer a question or if you wish to stop the interview, please let me know. For independent advice about this survey, you may contact the Chairman of the Advisory Panel on Ethics & Medico-Legal Affairs at the Ministry of Health and Wellness, Professor Archibald McDonald. May I start now?	UF10B. Now I would like to talk to you about (<i>child's name from UF3</i>)'s health and well-being in more detail. This interview will take about 20 minutes. Again, all the information we obtain will remain strictly confidential and anonymous. If you wish not to answer a question or if you wish to stop the interview, please let me know. For independent advice about this survey, you may contact the Chairman of the Advisory Panel on Ethics & Medico-Legal Affairs at the Ministry of Health and Wellness, Professor Archibald McDonald. May I start now?	
YES 1	1 ⇒UNDER FIVE'S BACKGROUND Module	
NO / NOT ASKED 2	2 ⇒UF17

UF15C. Thank you for your participation.

The Planning Institute of Jamaica will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 15 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?

MICS6.FS.15

FOUNDATIONAL LEARNING SKILLS		FL												
FL0. Check CB3: Child's age? Check HL6 in the List of Household Members Module in the HOUSEHOLD QUESTIONNAIRE for child if CB3 was not asked.	AGE 5-6 YEARS 1 AGE 7-14 YEARS 2 AGE 15-17 YEARS 3	1 ⇒End 3 ⇒End												
FL1. Now I would like to talk to (name) . I will ask (him/her) a few questions about (himself/herself) and about reading, and then ask (him/her) to complete a few reading and number activities. These are not school tests and the results will not be shared with anyone, including other parents or the school. You will not benefit directly from participating and I am not trained to tell you how well (name) has performed. The activities are to help us find out how well children in this country are learning to read and to use numbers so that improvements can be made. This will take about 20 minutes. Again, all the information we obtain will remain strictly confidential and anonymous.														
May I talk to (name) ?	YES, PERMISSION IS GIVEN 1 NO, PERMISSION IS NOT GIVEN 2	2 ⇒FL28												
FL2. Record the time.	HOURS AND MINUTES ____ : ____													
FL3. My name is (your name) . I would like to tell you a bit about myself. Could you tell me a little bit about yourself? <i>When the child is comfortable, continue with the verbal consent:</i> Let me tell you why I am here today. I am part of a team trying to find out how children are learning to read and to use numbers, on behalf of the Planning Institute of Jamaica. We are also talking to some of the children about this and asking them to do some reading and number activities. (Your mother/ Name of caretaker) has said that you can decide if you want to help us. If you wish to help us, I will ask you some questions and give you some activities to do. I will explain each activity, and you can ask me questions any time. You do not have to do anything that you do not want to do. After we begin, if you do not want to answer a question or you do not want to continue that is alright.														
Are you ready to get started?	YES 1 NO / NOT ASKED 2	2 ⇒FL28												
FL4. Before you start with the reading and number activities, tick each box to show that: <ul style="list-style-type: none"> <input type="checkbox"/> You are not alone with the child unless he/she is at least visible to an adult known to the child. <input type="checkbox"/> You have engaged the child in conversation and built rapport, e.g. using an icebreaker. <input type="checkbox"/> The child is sat comfortably, able to use the READING & NUMBERS BOOK without difficulty, while you can see which page is open. 														
FL6. First we are going to talk about reading. [A] Do you read books at home? [B] Does someone read to you at home?	<table border="0"> <tr> <td></td> <td style="text-align: right;">YES</td> <td style="text-align: right;">NO</td> <td></td> </tr> <tr> <td>READS BOOKS AT HOME.....</td> <td style="text-align: right;">1</td> <td style="text-align: right;">2</td> <td></td> </tr> <tr> <td>READ TO AT HOME</td> <td style="text-align: right;">1</td> <td style="text-align: right;">2</td> <td></td> </tr> </table>		YES	NO		READS BOOKS AT HOME.....	1	2		READ TO AT HOME	1	2

<p>FL18. Say: Jenny is older than Sam. Jenny is 6 and Sam is 5.</p>		<p>⇒FL23</p>
<p>FL18A. Turn the page to reveal the reading passage. Say: Thank you. Now I want you to try this.</p>		<p>⇒FL19</p>
<p>FL18B. Give the child the <i>READING & NUMBERS BOOK</i>.</p> <p>Open the book on the page of the reading passage.</p>		

MICS6.FS.18

<p>FL19. Here is a story. I want you to read it aloud as carefully as you can.</p> <p>You will start here (<i>point to the first word on the first line</i>) and you will read line by line (<i>point to the direction for reading each line</i>).</p> <p>When you finish, I will ask you some questions about what you have read.</p> <p>If you come to a word you do not know, go on to the next word.</p> <p>Put your finger on the first word. Ready? Begin.</p>	Randy	is	in	grade	two.	One	day,
	1	2	3	4	5	6	7
	Randy	was	going	home	from	school.	He
	8	9	10	11	12	13	14
	saw	some	red	flowers	on	the	way.
	15	16	17	18	19	20	21
	The	flowers	were	near	a	tomato	farm.
	22	23	24	25	26	27	28
	Randy	wanted	to	get	some	flowers	for
	29	30	31	32	33	34	35
	his	mother.	Randy	ran	fast	across	the
	36	37	38	39	40	41	42
	farm	to	get	the	flowers.	He	fell
	43	44	45	46	47	48	49
	down	near	a	banana	tree.	Randy	started
	50	51	52	53	54	55	56
	crying.	The	farmer	saw	him	and	came.
	57	58	59	60	61	62	63
	He	gave	Randy	many	flowers.	Randy	was
	64	65	66	67	68	69	70
	very	happy.					
	71	72					

MICS6.FS.19

<p>FL20. Results of the child's reading.</p> <p><i>Incorrect or missed words (B) are those marked incorrect while reading plus the difference between the number of the last word in the story (72) and the last word attempted (A).</i></p> <p><i>If the child did not try to read the story, record '00' as the last word attempted (A).</i></p>	<p>LAST WORD ATTEMPTED (A)..... NUMBER ___</p> <p>TOTAL NUMBER OF WORDS INCORRECT OR MISSED (B)..... NUMBER ___</p>	
<p>FL21A. Check FL20(B): Did the child incorrectly read or miss 8 or more words?</p>	<p>YES, AT LEAST 8 INCORRECT WORDS1 NO, LESS THAN 8 INCORRECT WORDS2</p>	1 ⇒FL23
<p>FL21B. Now I am going to ask you a few questions about what you have read.</p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark 'No response' and say: Thank you. That is ok. We will move on.</i></p> <p><i>Make sure the child can still see the passage and ask:</i></p> <p>[A] What grade is Randy in?</p> <p>[B] What did Randy see on the way home?</p> <p>[C] Why did Randy start crying?</p> <p>[D] Where did Randy fall?</p> <p>[E] Why was Randy happy?</p>	<p>CORRECT (TWO)..... 1 INCORRECT..... 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (FLOWERS)..... 1 INCORRECT..... 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (BECAUSE HE FELL)..... 1 INCORRECT..... 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (NEAR A BANANA TREE)..... 1 INCORRECT..... 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (BECAUSE THE FARMER GAVE HIM MANY FLOWERS OR BECAUSE HE HAD FLOWERS TO GIVE TO HIS MOTHER)..... 1 INCORRECT..... 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p>	

<p>FL23. Turn the page in the <i>READING & NUMBERS BOOK</i> so the child is looking at the list of numbers. Make sure the child is looking at this page.</p> <p>Now here are some numbers. I want you to point to each number and tell me what the number is.</p> <p>Point to the first number and say: Start here.</p> <p>If the child stops on a number for a while, tell the child what the number is, record '3', No attempt, point to the next number and say: What is this number?</p> <p>If the child does not attempt 2 consecutive numbers, record '3', No attempt, for remaining numbers and say: Thank you. That is ok.</p>	<p>9 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>12 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>30 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>48 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>74 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>731 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p>	
<p>FL23A. Check FL23: Did the child correctly identify two of the first three numbers (9, 12 and 30)?</p>	<p>YES, AT LEAST TWO CORRECT 1 NO, AT LEAST 2 INCORRECT OR WITH NO ATTEMPT 2</p>	<p>2 ⇒ FL27A</p>
<p>FL24. Turn the page so the child is looking at the first pair of numbers. Make sure the child is looking at this page. Say: Look at these numbers. Tell me which one is bigger.</p> <p>Record the child's answer before turning the page in the book and repeating the question for the next pair of numbers.</p> <p>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', No attempt, for the appropriate pair of numbers, turn the booklet page and show the child the next pair of numbers.</p> <p>If the child does not attempt 2 consecutive pairs, record '3', No attempt, for remaining pairs and say: Thank you. That is ok. We will go to the next activity.</p>	<p>7 & 5 CORRECT (7) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>11 & 24 CORRECT (24) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>58 & 49 CORRECT (58) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>65 & 67 CORRECT (67) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>146 & 154 CORRECT (154) 1 INCORRECT 2 NO ATTEMPT 3</p>	

<p>FL25. Give the child a pencil and paper. Turn the page so the child is looking at the first addition. Make sure the child is looking at this page. Say: Look at this sum. How much is (number plus number)? Tell me the answer. You can use the pencil and paper if it helps you.</p> <p>Record the child's answer before turning the page in the book and repeating the question for the next sum.</p> <p>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', No attempt, for the appropriate sum, turn the booklet page and show the child the next addition.</p> <p>If the child does not attempt 2 consecutive sums, record '3', No attempt, for remaining sums and say: Thank you. That is ok. We will go to the next activity.</p>	<p>3 + 2 CORRECT (5) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>8 + 6 CORRECT (14) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>7 + 3 CORRECT (10) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>13 + 6 CORRECT (19) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>12 + 24 CORRECT (36) 1 INCORRECT 2 NO ATTEMPT 3</p>	
<p>FL26. Turn to the first practice sheet for pattern recognition. Say: Here are some numbers. 1, 2, __, and 4.</p> <p>Point to each number and blank space and say: What number goes here?</p>	<p>CORRECT (3) 1 INCORRECT 2 NO ATTEMPT 3</p>	<p>2 ⇒ FL26B 3 ⇒ FL26B</p>
<p>FL26A. That's correct, 3. Let's do another one.</p>		<p>⇒ FL26C</p>
<p>FL26B. Do not explain how to get the correct answer. Just say: The number 3 goes here. Say the numbers with me. (Point to each number) 1, 2, 3, 4. 3 goes here. Let's do another one.</p>		
<p>FL26C. Here are some more numbers. 5, 10, 15 and ____.</p> <p>Point to each number and blank space and say: What number goes here?</p>	<p>CORRECT (20) 1 INCORRECT 2 NO ATTEMPT 3</p>	<p>2 ⇒ FL26E 3 ⇒ FL26E</p>
<p>FL26D. That's correct, 20.</p>		<p>⇒ FL27</p>
<p>FL26E. Do not explain how to get the correct answer. Just say: The number 20 goes here. Say the numbers with me. (Point to each number) 5, 10, 15, 20. 20 goes here.</p>		
<p>FL26F. Check FL26: Was the answer correct?</p>	<p>YES, FL26=1 1 NO, FL26=2 OR 3 2</p>	<p>2 ⇒ FL27A</p>

<p>FL27. Now I want you to try this on your own.</p> <p>Here are some more numbers. Tell me what number goes here (<i>pointing to the missing number</i>).</p> <p><i>Record the child's answer before turning the page in the book and repeating the question.</i></p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3'. No attempt, for the appropriate question, turn the page and show the child the next question.</i></p> <p><i>If the child does not attempt 2 consecutive patterns, record '3'. No attempt, for remaining patterns. and say:</i></p> <p>Thank you. That is ok.</p>	<p>5, 6, 7, __ CORRECT (8) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>14, 15, __, 17 CORRECT (16) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>20, __, 40, 50 CORRECT (30) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>2, 4, 6, __ CORRECT (8) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>5, 8, 11, __ CORRECT (14) 1 INCORRECT 2 NO ATTEMPT 3</p>	
<p>FL27A. That was my last question. I really enjoyed talking to you. It was very nice of you to help us out. Thank you very much.</p> <p><i>If you are asked by the child or the mother/caretaker how well the child has done, praise the child for effort but do not comment on performance. You may say:</i></p> <p>I am not trained to tell you how (you have/your child has) performed but (your/his/her) participation will help the authorities understand how much children are learning in Jamaica.</p>

FS15C. Thank you for your participation.

The Planning Institute of Jamaica will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 15 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?

E.2.2 Response cards for Life Satisfaction module

Best Possible Life

Worst Possible Life

FL module booklet

Sam is a cat. Jenny is a dog. Sam is 5. Jenny is 6.

Ⓟ

Randy is in grade two. One day, Randy was going home from school. He saw some red flowers on the way. The flowers were near a tomato farm. Randy wanted to get some flowers for his mother. Randy ran fast across the farm to get the flowers. He fell down near a banana tree. Randy started crying. The farmer saw him and came. He gave Randy many flowers. Randy was very happy.
